I am hereby informing you of the health status of commercial poultry flocks listed above. The following diseases have not been reported on the farm for the last 30 days: Marek's disease, tuberculosis, pasteurellosis, infectious bronchitis (other than vaccine-induced), or Gumboro disease (caused by classic highly virulent strains not present in the US and serogroup II). The flock has not exhibited signs of Salmonellosis.

I certify that:

-Poultry genetic line for slaughter originated from primary breeder flocks which are included in the National Poultry Improvement Plan (NPIP).

-Poultry originated on farms that have been inspected by USDA, APHIS accredited veterinarians.

-Poultry did not receive feed containing hormones, antibiotics and other preparations intended for stimulating growth other than bambermycin, bacitracin or virginiamycin.

-Poultry did not receive tetracycline, chlortetracycline or oxytetracycline.

-Poultry did not receive chloramphenicol.

Were growth stimulating antibiotics (bambermycin, bacitracin, or virginiamycin) used? \_\_\_ Yes \_\_\_ No If yes, identify the antibiotic \_\_\_\_\_

Were therapeutic antibiotics used? \_\_\_ Yes \_\_\_ No If yes, identify the antibiotic(s)

\_\_\_\_\_

Were organic arsenicals (3-nitro, Roxarsone, Progen) used? \_\_\_ Yes \_\_\_ No
