FSIS DIRECTIVE
AIR CONTAMINANTS SAFETY AWARENESS PROGRAM

4791.8

6/19/96

I. BACKGROUND

A new issuance, FSIS Directive 4791.8, Air Contaminants Safety Awareness Program, has been developed. This directive issues guidelines for developing and managing an air contaminants safety awareness program. Exposure limits for air contaminants are found in 29 CFR 1910.1000, Air Contaminants. A copy of this CFR section is distributed with FSIS Directive 4791.8 for referencing convenience.

II. CANCELLATION

Cancel this transmittal sheet when the directive is filed and the copy of 29 CFR 1910.1000 is received to use as needed. For recordkeeping purposes, users may retain or destroy this transmittal sheet.

AIR CONTAMINANTS SAFETY AWARENESS PROGRAM

I. PURPOSE

This directive contains general provisions and guidelines to develop and manage an air contaminants safety awareness program.

II. (RESERVED)

III. REASON FOR ISSUANCE

This directive establishes a program to monitor, detect, and report FSIS employee exposure to harmful air contaminants in plant environments.

It is FSIS policy to assure that safe and healthful working conditions are provided for all FSIS employees.

VII. **COVERAGE AND APPLICABILITY**

This directive covers all field employees with regulatory functions in IO, IP, and RP and applies to all FSIS employees required to work in or visit official plant locations where hazardous chemicals or toxic materials are used. **NOTE:** This directive does not cover FSIS employees who are or may have been exposed to biological contaminants while working in or visiting a plant.

VIII. **DEFINITIONS**

A. **Air Contaminant.** A toxic or hazardous material, chemical, or substance listed in 29 CFR 1910.1000. (**EXAMPLES:** ammonia, carbon dioxide, carbon monoxide, and chlorine.)

B. **Chemical Badge.** (Also called a detector tube.) A device that measures exposure levels of hazardous chemicals and toxic materials.

C. **Exposure.** Field employees with regulatory functions who are subjected by any route of entry including inhalation, ingestion, skin contact, and absorption during employment to a chemical or material that is a physical or health hazard. This includes potential (**EXAMPLES:** accidental or possible) exposure.

D. **Hazardous Chemical.** Any chemical that OSHA has determined is a physical or health hazard.

E. **Industrial Hygienist.** A person with the academic knowledge and experience to determine the effects upon health of chemicals and physical agents under various levels of exposure. The IH is involved in monitoring, engineering, and analyzing methods to detect the extent of exposure for hazard control purposes.

F. **Regional OSH Official.** The full-time IO employee serving as the IO safety and health expert at the regional level.

G. **IO Safety and Health Manager.** The full-time IO employee serving as the primary and technical safety and health expert within IO.

H. **Material Safety Data Sheet.** Written or printed material on a hazardous chemical that is prepared according to the OSHA standard in 29 CFR 1910.1200.

I. **Toxic Material.** A material in a concentration or an amount exceeding the permissible limit established by OSHA, or that is of such toxicity it constitutes a recognized immediate or potential hazard.

IX. AIR CONTAMINANTS MONITORING

The in-plant supervisor or IIC, with assistance from the field office staff and Regional OSH Official, takes the following actions to effectively monitor exposure to air contaminants.

(NOTE: A mechanical engineer, IH, or other qualified person may be used in the review and assessment process if determined to be necessary by the Regional OSH Official and the IO Safety and Health Manager.)

A. Monitors Workplaces. Conducts an air contaminants exposure review and assessment of the assigned plant when:

1. New hazardous chemicals are **introduced** into plant operations.
2. Employees complain of sore throats, headaches, or eyes and nose irritations, and air contaminants are suspected as the cause.

B. Surveys Workplaces. Determines if exposure to air contaminants exists within the plant by reviewing and assessing the:

1. Ventilation system (i.e., exhaust fans ratings and make-up air supply capacities) design (i.e., blueprints and mechanical engineer reports).
2. Results of OSH inspections and IH surveys.
3. Results of the Air Contaminants Safety Awareness Program reviews and assessments of the plant's existing ventilation system, OSH inspections, and IH surveys. This allows the supervisor or IIC to identify areas within the plant that routinely handle, use, or store hazardous chemicals or toxic materials and determine if the identified areas are equipped with a ventilation system that provides a workplace environment free from known air contaminants.

C. Reviews the Logs of On-Duty Injuries and Illnesses (FSIS Forms 4791-17). Reviews and analyzes FSIS Forms 4791-17 for FSIS employees assigned to work in plants where hazardous chemicals or toxic materials are routinely present in order to identify over-exposure possibilities.

D. Protects Employees From Exposure. Reviews FSIS Directive 4791.5 including the most up-to-date MSDS's and makes periodical OSH inspections to assess that:

1. Plant management is adhering to the MSDS guidelines for using hazardous chemicals.
2. Incompatible hazardous chemicals are not being mixed by plant employees, especially housekeeping personnel, resulting in employee exposure to air contaminants.

X. AIR CONTAMINANTS EXPOSURE PROCEDURES

Air contaminants exposure conditions for a safe and healthy workplace are to be initially measured according to the OSHA standards in 29 CFR 1910.1000. When an unhealthy air contaminant exposure condition is suspected in the plant, the supervisor or IIC will issue chemical-direct reading badges or detector tubes for a specific known airborne contaminant such as ammonia, carbon dioxide and chlorine, to be worn by FSIS employees assigned to the suspected work areas. (**NOTE:** Chemical-direct reading badges or detector tubes for known airborne contaminants are issued through the Regional OSH Official. However, all known chemicals' airborne contaminant concentrations cannot be determined by direct reading badges or detector tubes.) The following exposure procedures and guidelines apply.

A. If a chemical badge or tube indicates levels of chemical exposure above OSHA PELS, the supervisor or IIC shall ensure that the employee's amount and duration of exposure to any air contaminant is limited to those levels specified in 29 CFR 1910.1000. The supervisor or IIC will:

1. Conduct immediate withdrawal of employees from the affected work area(s), as necessary, to assure that employees are no longer exposed to a chemical above PELS.
2. Inform plant management of the withdrawal of FSIS employees from the affected areas, the circumstances, and the plan to return to duty when concentration of the chemical no longer exceeds PELS.
3. Contact the immediate supervisor. The supervisor will contact the Regional OSH Official. The Regional OSH Official immediately becomes involved to resolve the exposure problem. (**NOTE:** A mechanical engineer, IH, or other qualified person may be used in the air contaminant exposure evaluation if determined to be necessary by the Regional OSH Official and the IO Safety and Health Manager.)

B. If a chemical badge or tube indicates levels of chemical exposure **safely below** OSHA PELS, but FSIS employees continue to complain of headaches, sore eyes, sore throats or other physical aches, the supervisor or IIC requests the area supervisor to contact the Regional OSH Official. The Regional OSH Official immediately becomes involved to resolve the suspected exposure problem. (**NOTE:** A mechanical engineer, IH, or other qualified person may be used in the suspected air contaminant exposure evaluation if determined to be necessary by the Regional OSH Official and the IO Safety and Health Manager.)

C. If the air contaminants in the FSIS employee work areas are **not known**, but FSIS employees complain of physical symptoms similar to those described in subparagraph B., follow the same procedures in subparagraph B. The Regional OSH Official immediately becomes involved to resolve the exposure problem. (**NOTE:** A mechanical engineer, IH, or other qualified person may be used in the suspected air contaminant exposure evaluation if determined to be necessary by the Regional OSH Official and the IO Safety and Health Manager.)

XI. COMMUNICATING WITH PLANT MANAGEMENT

When an air contaminant exposure condition is determined by any means including OSH inspections and IH surveys, the in-plant supervisor or IIC with assistance from the field office staff and the Regional OSH Official, shall immediately contact and meet with plant management. The in-plant supervisor, IIC, and/or area supervisor shall:

- A. Implement administrative controls as needed, and recommend to plant management that engineering controls or other controls be implemented to abate the air contaminant problem. (**EXAMPLES:** Administrative controls would be work practice changes or modifications, and engineering controls would be ventilation changes, chemical substitution, process isolation, and equipment modifications.)
- B. Recommend to plant management when controls listed in subparagraph A. are not feasible to achieve full abatement, that protective equipment or other protective measures (**EXAMPLES:** installing gas alarms at work stations and establishing a gas detectors/monitors exposure program) be implemented to keep the exposure within OSHA PELS.
- C. Inform plant management of the withdrawal of FSIS employees from the plant to the extent necessary to assure FSIS employee protection.

XII. MEDICAL EVALUATION

Medical tests and medical monitoring shall be established and provided for FSIS employees required to conduct work tasks in plants where IH tests or OSH inspections have confirmed exposure over the PELS or FSIS employees have complained of physical symptoms similar to those described in Subparagraph X. B.

A. **Physician.** The required medical tests and medical monitoring shall be supervised by a physician and the extent of the medical services provided will be dictated by the FSIS employee's exposure to the hazardous chemical. The employee should provide the physician with information related to the chemicals (i.e., copies of MSDS's) to which he or she was exposed, the nature of the symptoms experienced, and the results of any IH surveys or air contaminant sampling performed at the duty location related to the air contaminant exposure.

B. **Workplace Injuries.** FSIS employees injured from exposure to air contaminants of hazardous chemicals, confirmed by IH tests or OSH inspections to have been over the PELS, are classified as workplace injuries or illnesses. See FSIS Directive 4810.1 for compensation benefits and claim filing instructions.

XIII. RECORDKEEPING

Keep the testing and monitoring results records used to determine exposure to air contaminants for the duration of the affected employee's employment plus 30 years. All employee medical records on medical tests and medical monitoring are confidential and are kept according to FSIS Directive 4293.1.

XIV.

ASSISTANCE AND CONSULTATION

Field supervisors needing immediate assistance or consultation to determine whether exposure to hazardous employment conditions exists in their field workplaces may contact an OSH Official or the IO Safety and Health Manager directly. IP and RP field employees who work in or visit a meat, poultry, or egg products plant may request assistance from the Regional OSH Official. They may contact an in-plant supervisor or IIC, or the Area or Regional Office. **NOTE:** FSIS employees have the right to report air contaminants exposure conditions in their workplace environments to appropriate OSH officials.

29 Code of Federal Regulations (CFR) 1910  
~~~~~

29 CFR 1910.1000
Air Contaminants:

An employee's exposure to any substance listed in Tables Z-1, Z-2, or Z-3 of this section shall be limited in accordance with the requirements of the following paragraphs of this section.

(a) Table Z-1:

- (1) Substances with limits preceded by ' 'C' ' - Ceiling Values. An employee's exposure to any substance is Table Z-1, the exposure limit of which is preceded by a ' 'C' ', shall at no time exceed the exposure limit given for that substance. If instantaneous monitoring is not feasible, then the ceiling shall be assessed as a 15-minute time weighted average exposure which shall not be exceeded at any time during the working day.
- (2) Other substances-8-hour Time Weighted Averages. An employee's exposure to any substance is Table Z-1, the exposure limit of which is not preceded by a ' 'C' ', shall not exceed the 8-hour Time Weighted Average given for that substance in any 8-hour work shift of a 40-hour work week.

(b) Table Z-2. An employee's exposure to any substance listed in Table Z-2 shall not exceed the exposure limits specified as follows:

- (1) 8-hour time weighted averages. An employee's exposure to any substance listed in Table Z-2, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average limit given for that substance in Table Z-2 .
- (2) Acceptable ceiling concentrations. An employee's exposure to a substance listed in Table Z-2 shall not exceed at any time during an 8-hour shift the acceptable ceiling concentration limit given for the substance in the table, except for a time period, and up to a concentration not exceeding the maximum duration and concentration allowed is the column under "acceptable maximum peak above the acceptable ceiling concentration for an 8-hour shift."

(3) Example. During an 8-hour work shift, an employee may be exposed to a concentration of Substance A (with a 10 ppm TWA, 25 ppm ceiling and 50 ppm peak) above 25 ppm (but never above 50 ppm) only for a maximum period of 10 -minutes. Such exposure must be compensated by exposures to concentrations less than 10 ppm so that the cumulative exposure for the entire 8-hour work shift does not exceed a weighted average of 10 ppm.

(c) Table Z-3. An employee's exposure to any substance listed in Table Z-3, in any 8-hour work shift of a 40-hour work week, shall not exceed the 8-hour time weighted average limit given for that substance in the table.

(d) Computation formulae. The computation formula which shall apply to employee exposure to more than one substance for which 8-hour time weighted averages are listed in subpart Z of 29 CFR part 1910 in order to determine whether an employee is exposed over the regulatory limit is as follows:

(1)

(i) The cumulative exposure for an 8-hour work shift shall be computed as follows:

$$E = (C_1T_1 + C_2T_2 + \dots + C_nT_n) + 8$$

Where:

E is the equivalent exposure for the working shift.

C is the concentration during any period of time T where the concentration remains constant.

T is the duration in hours of the exposure at the concentration C.

The value of E shall not exceed the 8-hour time weighted average specified in subpart Z of 29 CFR part 1910 for the substance involved.

(ii) To illustrate the formula prescribed in paragraph (d)(1)(i) of this section, assume that Substance A has an 8-hour time weighted average limit of 100 ppm noted in Table Z-1. Assume that an employee is subject to the following exposure:

Two hours exposure at 150 ppm

Two hours exposure at 75 ppm

Four hours exposure at 50 ppm

Substituting this information in the formula, we have

$$(2 \times 150 + 2 \times 75 + 4 \times 50) + 8 = 81.25 \text{ ppm}$$

Since 81.25 ppm is less than 100 ppm, the 8-hour time weighted average limit, the exposure is acceptable.

(2)

- (i) in case of a mixture of air contaminants as employer shall compute the equivalent exposure as follows:

$$Em = (C_1 + L_1 + C_2 + L_2) + \dots + (C_n + L_n)$$

Where:

Em is the equivalent exposure for the mixture.

C is the concentration of a particular contaminant.

L is the exposure limit for that substance specified in subpart Z of 29 CFR part 1910.

The value of Em shall not exceed unity (1).

- (ii) To illustrate the formula prescribed in paragraph (d)(2)(i) of this section, consider the following exposures;

Substance	Actual concentration of 8-hour exposure (ppm)	8-hour TWA PEL (ppm)
B	500	1,000
C	45	200
D	40	200

Substituting in the formula, we have:

$$Em = 500 + 1,000 + 45 + 200 + 40 + 200$$

$$Em = 0.500 + 0.225 + 0.200$$

$$Em = 0.925$$

Since Em is less than unity (1), the exposure combination is within acceptable limits.

- (e) To achieve compliance with paragraphs (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with 1910.134.

- (f) Effective dates. The exposure limits specified have been in effect with the method of compliance specified in paragraph (e) of this section since May 29, 1971.

{1} The PELs are 8-hour TWAs unless otherwise noted; a (C) designation denotes a ceiling limit. They are to be determined from breathing-zone air samples.

- (a) Parts of vapor or gas per million parts of contaminated air by volume at 25 °C and 760 torr.
- (b) Milligrams of substance per cubic meter of air. When entry is in this column only, the value is exact; when listed with a ppm entry, it is approximate.
- (c) The CAS number is for information only. Enforcement is based on the substance name. For an entry covering more than one metal compound, measured as the metal, the CAS number for the metal is given—not CAS numbers for the individual compounds.
- (d) The final benzene standard in 1910.1028 applies to all occupational exposures to benzene except in some circumstances the distribution and sale of fuels, sealed containers and pipelines, coke production, oil and gas drilling and production, natural gas processing, and the percentage exclusion for liquid mixtures; for the excepted subsegments, the benzene limits in Table Z-2 apply. See 1910.1028 for specific circumstances.
- (e) This 8-hour-TWA applies to respirable dust as measured by a vertical elutriator cotton dust sampler or equivalent instrument. The time-weighted average applies to the cotton waste processing operations of waste recycling (sorting, blending, cleaning and willowing) and garnetting. See also 1910.1043 for cotton dust limits applicable to other sectors.
- (f) All inert or nuisance dusts, whether mineral, inorganic, or organic, not listed specifically by substance name are covered by the Particulates Not Otherwise Regulated (PNOR) limit which is the same as the inert or nuisance dust limit of Table Z-3.

{2} See Table Z-2.

{3} See Table Z-3.

{4} Varies with compound.

(a) This standard applies to the industry segments exempt from the 1 ppm 8-hour TWA and 5 ppm STEL of the benzene standard at 1910.1028.

(b) This standard applies to any operations or sectors for which the Cadmium standard, 1910.1027, is stayed or otherwise not in effect.

Table Z-3 Mineral Dusts

Substance	ppmcf(s)	mg/m ³
Silica: Crystalline Quartz (Respirable)	$\frac{250(b)}{4810^aT2+5}$	$\frac{10 \text{ mg/m}^3(s)}{4810^aT2 + 2}$
Quartz (Total Dust)	$\frac{30 \text{ mg/m}^3}{4810^aT2+2}$
Cristobalite: Use 1/2 the value calculated from the count or mass formulae for quartz.
Tridymite: Use 1/2 the value calculated from the formulae for quartz.
Amorphous, including natural diatomaceous earth. 20	$\frac{80 \text{ mg/m}^3}{4810^aT2}$
Silicates (less than 1% crystalline silica):		
Mica	20
Soapstone	20
Talc (not containing asbestos) ..	20(s)
Talc (containing asbestos): Use asbestos limit.		
Tremolite, amphiboliform (see 29 CFR 1910.1001).	
Portland cement	50
Graphite (Natural)	10
Coal Dust:		
Respirable fraction less than 5 $\frac{4 \text{ mg/m}^3}{4810^aT2}$	$2.4 \text{ mg/m}^3(s)$

Table Z-3 Mineral Dusts

Substance	mppcf{a}	mg/m ³
Respirable fraction greater than 5% SiO ²	10 mg/m ³ {e} %SiO ² +2
Inert or Nuisance Dust{d}:		
Respirable fraction	15	5 mg/m ³
Total dust	50	15 mg/m ³

Note—Conversion factors - mppcf X 35.3 = million particles per cubic meter = particles per C.C.

- {a) Millions of particles per cubic foot of air, based on impinger samples counted by light-field techniques.
- {b} The percentage of crystalline silica in the formula is the amount determined from airborne samples, except in those instances in which other methods have been shown to be applicable.
- {c) Containing less than 1% quartz; if 1% quartz or more, use quartz limit.
- {d) All inert or nuisance dusts, whether mineral, inorganic, or organic, not listed specifically by substance name are covered by this limit, which is the same as the Particulates Not Otherwise Regulated (PNOR) limit in Table Z-1.
- {e) Both concentration and percent quartz for the application of this limit are to be determined from the fraction passing a size-selector with the following characteristics:

Aerodynamic diameter (unit density sphere)	Percent passing selector
2.....	90
2.5.....	75
3.5	50
5.0.....	25
10.....	0

The measurements under this note refer to the use of an AEC (now NRC) instrument. The respirable fraction of coal dust is determined with an MRE; the figure corresponding to that of 2.4 mg/m³ in the table for coal dust is 4.5 mg/m³.
