SHIGA TOXIN-PRODUCING *E. coli*

ADDRESSING THE CHALLENGES,

MOVING FORWARD WITH SOLUTIONS

+ + + + +

April 10, 2008

8:00 a.m.

Holiday Inn Georgetown
2101 Wisconsin Avenue, N.W.
Washington, D.C. 20007

MODERATOR: MR. DAVID GOLDMAN
Assistant Administrator
Office of Public Health Science
Food Safety and Inspection Service

FSIS:

MR. ALFRED V. ALMANZA, Administrator
DR. RICHARD RAYMOND
DR. H. SCOTT HURD

PRESENTERS:

DR. GUY LONERAGAN
DR. MANDY CARR
DR. DEAN DANIELSON
DR. TIMOTHY JONES
MR. HUGH TYLER
DR. RANDALL HUFFMAN
MS. DONNA ROSENBAUM
DR. DANIEL ENGELJOHN

Free State Reporting, Inc.
1378 Cape St. Claire Road
Annapolis, MD 21409
(410) 974-0947

ALSO PARTICIPATING:

MS. FELICIA NESTOR
MR. CHRISTOPHER WALDROP
MR. DAVE LOVETRO
MS. NANCY DONLEY
MS. PATRICIA BUCK
MR. RICHARD WOOD
MR. WOLF MAIER
MS. CAROL TUCKER-FOREMAN
MR. DAVID NESMITH
MS. LISA SHINE
MR. STAN PAINTER
MR. SHAWN STEVENS
MS. JEANNIE MEEHL
MR. CARL CUSTER
DR. MERV BAKER

I-N-D-E-X

<u>AGENDA ITEM</u>	<u>PAGE</u>
Opening Remarks	375
Dr. David Goldman, Assistant Administrator, Office of Public Health Science, Food Safety and Inspection Service	
Recap of Day One	377
Mr. Alfred V. Almanza, Administrator, Food Safety and Inspection Service	
Perspectives, Research Progress and Moving Forward With Solutions	
Issues and Hypotheses at the Pre-Harvest and Processing Stages	
Dr. Guy Loneragan, Assistant Professor Epidemiologist, Feedlot Research Group West Texas A&M University	379
Dr. Mandy Carr, Executive Director for Research, National Cattlemen's Beef Association	407
Dr. Dean Danielson presenting for Dr. James Reagan, Chairman, Beef Industry Food Safety Council	430
Questions and Comments on the Issues and Hypotheses at the Pre-Harvest and Processing Stages	444
Bringing the Pieces Together - Panelist Statements	485
Dr. Timothy Jones, State Epidemiologist and Acting Chief Medical Officer, Tennessee Department of Health	490
Mr. Hugh Tyler, The Butcher Shop, Columbia, South Carolina	494

I-N-D-E-X

<u>AGENDA ITEM</u>	<u>PAGE</u>
Dr. Randall Huffman, Vice President of Scientific Affairs, American Meat Institute	498
Ms. Donna Rosenbaum, Cofounder and Executive Director of Safe Tables Our Priority (STOP)	506
Dr. Daniel Engeljohn, Deputy Assistant Administrator, Office of Policy and Program Development, Food Safety and Inspection Service	511
Bringing the Pieces Together - Panel Discussion	512
Public Comment	547
Closing Remarks	
Dr. H. Scott Hurd, Deputy Under Secretary for Food Safety, U.S. Department of Agriculture	576
Adjourn	

1 P-R-O-C-E-E-D-I-N-G-S

2 (8:39 a.m.)

3 MR. GOLDMAN: Please take your seats, we'll
4 get started with Day 2, actually a half a day of our
5 day and a half conference on Shiga Toxin-Producing *E.*
6 *coli*.

7 I want to welcome everyone back, both those
8 in the room and those on the phone. For those on the
9 phone, we were aware throughout the day yesterday
10 that there were some audio problems for those of you
11 listening in. We were aware of those. We have made
12 attempts to correct them as much as possible. So
13 hopefully the audio quality for today's presentations
14 will be better than it was yesterday, and we
15 appreciate your patience and your participation as
16 well.

17 Just to remind everyone, when you do come
18 to the microphone, please speak loudly and clearly
19 into the mic and let us know who you are and what
20 agency or organization you represent so we can get it
21 all properly transcribed. And speaking of
22 transcript, I think we expect the transcript usually

1 take about two weeks to get posted. So you can look
2 forward to that, and again your clarity into the
3 microphones will assist in transcription.

4 Let me just orient you to today's agenda,
5 and it will be slightly different than yesterday and
6 then we'll have Mr. Almanza come up in just a minute
7 and kind of give us a charge for Day 2.

8 The agenda today is just really split into
9 two sessions. The first session will be from three
10 scientists who will give their perspectives about
11 perhaps what happened last year and what might be put
12 in place this year to prevent a recurrence of last
13 year from the pre-harvest and post-harvest
14 perspectives, and then the last panel of the day will
15 have five panelists come up here that we've
16 assembled, and we'll ask them to react to a series of
17 questions that I think everybody should have in your
18 agenda, and then we'll invite the participants in the
19 meeting, in the audience, to join in, give their own
20 perspectives or ask questions of those panelists.

21 I think that covers our agenda for the day.
22 I'll ask our Agency Administrator, Mr. Almanza, if he

1 would like to come forward and give us a few words
2 about yesterday and what he'd like to see from today
3 perhaps.

4 MR. ALMANZA: Well, good morning. I just
5 want to start out with kind of reiterating what I
6 talked about yesterday morning about we're going to
7 explore options. I think that that's important, that
8 we keep that in mind. We saw a lot of Agency data,
9 covered a lot of Agency information and looked or
10 heard some policy considerations. And also, I want
11 everybody to remember that we're here for the same
12 purpose, to reduce foodborne illnesses. I mean
13 that's the key to what we're going to do here, what
14 we're going to try to accomplish here.

15 The one thing that I do want to focus on is
16 yesterday you heard from us, you heard from the
17 Agency. You saw information that we have. Today we
18 want to hear from you. We want to know what it is
19 that you're thinking. I know there doesn't seem to
20 be very many shy people here. So we need to continue
21 that.

22 I also want to tell you that following this

1 meeting, there's going to be a 30-day comment period.
2 Feel free to comment. We need all your comments, so
3 that we do go down the right path to tackle this
4 issue.

5 With that, I just want to continue the hard
6 work and the open dialogue that we had yesterday.
7 Thank you.

8 DR. GOLDMAN: Thank you very much, Al. If
9 I could ask my first set of panelists to come up,
10 we'll get started with this next panel. And I will
11 let you know that we have a substitute. Dr. Dean
12 Danielson will be presenting in place of Dr. Reagan.

13 All right. We'll hear from three of these
14 researchers in order here.

15 Dr. Guy Loneragan is an Associate Professor
16 in Epidemiology at West Texas A&M for the last six
17 years. He has a Veterinary Degree from the
18 University of Sydney, and a Master's and Ph.D. in
19 Epidemiology from Colorado State University. His
20 focus at the West Texas A&M in his research is on
21 pre-harvest controls and ecology of *E. coli* O157:H7,
22 *Salmonella* in cattle populations and the determinants

1 and controls of antibiotic resistance in enteric
2 bacteria of cattle. So please welcome Dr. Loneragan.

3 (Applause.)

4 DR. LONERAGAN: Thank you very much for
5 that kind introduction. Dr. Raymond, Dr. Hurd, it
6 really is an honor to be here to present today. I
7 can't tell you how much of an honor it really is, but
8 it also is a challenge because what we're talking
9 today about is an unusual bacterium, and the more we
10 look at this, the more we find that things are
11 certainly unique about this bacterium.

12 And what we're dealing with here is a
13 pathogen of people but when we start talking about
14 pre-harvest control of this organism, we're really
15 talking about commensal of cattle rather than a
16 pathogen of cattle. And, we're very used to dealing
17 with pathogens in animals as a veterinarian, and so
18 now we're trying to modify a commensal in a natural
19 host of the organism which makes it certainly more
20 challenging.

21 So what I'd like to talk about today is
22 what potentially could have happened pre-harvest

1 during 2007 that may explain the increased occurrence
2 of recalls and illnesses. I'd also like to talk then
3 about what are the opportunities at pre-harvest to
4 control this pathogen and then finally make a short
5 summary.

6 So when we start thinking about what could
7 have happened in 2007, what I've done on this slide
8 is try to break up the industry into fairly broad
9 areas. So here's pre-harvest, the harvest,
10 distribution, the point at which it's consumed and
11 then the consumers, and we can go through a series of
12 exercises whereby we propose different hypotheses at
13 different levels of organization. So we can go
14 through the exercise of the consumer and propose a
15 series of hypotheses, the validity of which doesn't
16 really matter at this stage, but we're just proposing
17 different scenarios of what might have happened, and
18 we can go through this exercise at different levels
19 of organization and what I'm going to talk about
20 today is the pre-harvest levels of organization.

21 And so the first one is that there's a
22 change in prevalence that may have been attributable

1 to some sort of macro, microclimatic conditions.
2 There's been a lot of talk about the use of
3 distillers grains, changes in certain subtype,
4 decreased use of a lactic acid bacteria, as well as
5 different methods of finishing cattle.

6 So in that regard, let me begin with the
7 distillers grain discussion, and this certainly has
8 received a lot of press. Not long ago, in December,
9 there were a lot of press releases about a study from
10 Kansas State whereby they found that in cattle that
11 were fed distillers grains, they observed an
12 increased prevalence of *E. coli* 0157 versus cattle
13 that weren't fed distillers grains, and there were
14 some other data that supported these observations.
15 Grant Dewell from Colorado State University also
16 published relatively recently where they saw brewer's
17 grain associated with increased prevalence.

18 And the summary of the results are
19 presented in this graphic here where on an X axis I
20 have prevalence of *E. coli* 0157 and the diets. A
21 controlled diet has 0 percent distillers grains and
22 then these two diets have 25 percent distillers

1 grains, and these were statistically significant.
2 And this was a -- finding. It was also an
3 experimental study. It received a lot of press and a
4 lot of interest. What these data are based on is
5 actually this graph here. So this is broken out by
6 week now. So it's the same data in the graph
7 previously which was summarized but here's the data
8 over time. And if you look more closely at this,
9 you'll see that the 25 percent distillers grain, the
10 ones with the square here, is actually all driven by
11 this one data point.

12 So when we start looking at the data in
13 detail, there might be something a little bit more
14 confusing. So if we block out those weeks and just
15 look at what it began with, they're all very similar
16 and what the cattle ended with again is very similar.
17 And you can see that the control, the 0 percent
18 distillers grains sits right in between the two 25
19 percent, and I think if we had just seen this data,
20 we would probably come to a very different
21 conclusion.

22 But, regardless of that, distillers grains

1 and production of distillers grains is on the
2 increase. So the purple dots represent plants in
3 production. The yellow dots represent plants under
4 construction. I come from the Texas Panhandle here,
5 and these two dots that overlap, one is in production
6 now and one is soon to be in production. So these
7 are rapidly changing.

8 And what this has done to the price of
9 corn, we've all heard about what's happening to the
10 price of commodities. You'll see that basically last
11 September, the price of corn went from \$2 to \$4 or
12 more than \$4 in January, and if we updated this now,
13 it's approaching the \$6 mark as of now. So certainly
14 the demand for corn has increased.

15 And not surprisingly as we increase the
16 production of ethanol, we also will increase
17 production of distillers grains. So if there's an
18 association, we're going to be producing a lot more
19 distillers grains and the green bars represent
20 estimates. This estimate might be a little bit high,
21 but who knows. Certainly there's going to be a lot
22 more distillers grains and that has to go somewhere.

1 And basically what we're seeing is where is
2 the distillers grain going, and this table represents
3 the percent of cattle operations that are currently
4 using distillers grains, those that are not using but
5 are considering, and those that are not using and not
6 considering. And, if you'll look at this, you'll see
7 that roughly one in three feedlots are already using
8 distillers grains and another third is considering
9 using it in the near future. So really this has a
10 wide penetration. So this vast amount of distillers
11 grains are going to be used in livestock feeds.

12 This may seem problematic if there really
13 is an association but I think we have to be a little
14 bit cautious about making that association. If you
15 cast your mind back to a decade ago, there was a lot
16 of press about how we can change the diet of cattle
17 to reduce *E. coli* O157, and that was do we switch
18 them from a starch-based diet or to a hay-based diet.
19 And so we're led to believe at that stage, that high
20 starch diets were the culprit. Since then, we've
21 evaluated this and this is certainly not as clear cut
22 as it was made out to be but if we think that high

1 starch diets were the culprit, well, then when we add
2 distillers grains to it, we're actually replacing a
3 lot of starch with digestible fiber, and so now we're
4 actually making the opposite argument that maybe
5 starch is a benefit relative to a fiber diet.

6 So I'm not quite sure we're ready yet to
7 blame distillers grains for any change in *E. coli*
8 0157. I believe it's somewhat premature. My
9 personal thought is I believe that distillers grains
10 has little or negligible effect on *E. coli* 0157 and
11 at the bottom of this slide, I have some data that
12 were published out of Nebraska by Dave Smith and
13 colleagues, in which they compared a diet with 10,
14 20, 30, 40 and 50 percent distillers grains compared
15 to a control that didn't have any. They found that
16 10, 20 and 30 percent were less likely to shed it
17 than the controls, and 40 and 50 percent were more
18 likely to shed than the controls.

19 And again, I think what we're observing
20 here is endemic instability in *E. coli* 0157 shedding
21 whereby we assign treatment effects to what is
22 essentially an unstable shedding pattern.

1 And more recently from the same group of
2 researchers that had the press release last November
3 and December, that received a lot of press, that
4 linked distillers grains to *E. coli* 0157, they've
5 since completed another study and have just as of
6 Tuesday of this week released the fact that the
7 latest study found no association between the use of
8 distillers grains and *E. coli* 0157.

9 So my thought is that while this was an
10 interesting finding and worth following up, I don't
11 think we're going to find that there are substantial
12 effects of distillers grains on *E. coli* 0157
13 shedding.

14 In terms of the climatic hypotheses that we
15 talked about, certainly there is a strong seasonal
16 driver of *E. coli* 0157 shedding in cattle. So the
17 warmer months we see a lot more shedding than we do
18 in the cooler months.

19 So could there be a macroclimatic change
20 that could have accounted for 2007. I certainly
21 think there's some interest in looking at that, but
22 there's also some evidence that condition of the pen

1 surface may influence shedding. And this again was
2 published out of Nebraska by Dave Smith and his
3 colleagues and this is more micro regional climatic
4 changes. But they found that when the pen surface is
5 overly dry and dusty or overly wet, then shedding
6 tends to go up compared to an optimal pen surface.
7 So this is more the normal for West Texas. This is a
8 feed lot with a dusty environment, more extreme than
9 normal, but certainly this is more what we're used to
10 seeing, whereas this certainly is a catastrophic rain
11 event when we have extremely muddy pens. And, so the
12 hypothesis is that one of these may have occurred
13 more often in 2007 relative to what we would expect
14 to be an ideal pen surface.

15 So we can look at precipitation deviations
16 to see if much happened, and we can see that for
17 2007, certainly most of the cattle on feed are in
18 this region of the country and there's a lot of wet
19 areas or extremely wet areas in the areas where
20 cattle are fed. And we can do this by month. March
21 was a very warm and wet month in the Texas Panhandle,
22 but fairly normal elsewhere, but if we look at

1 different months, we see that this is actually drier.
2 So I'm not quite sure how we're going to pull apart
3 some of these macroclimatic events.

4 But, the hypotheses is that some
5 macroclimatic change was associated with a) a change
6 in prevalence in the cattle presented for harvest,
7 and b) quite a logical conclusion, increased recalls
8 during 2007.

9 It certainly is an interesting concept that
10 warrants further investigation, and there is some
11 very limited data that may support this. However, I
12 believe it's very challenging to develop and
13 implement testable hypotheses to evaluate whether
14 this actually happened.

15 So certainly if we can, what can we change?
16 So is this a controllable event that we can deal
17 with, and the answer is likely not. And it also is
18 challenging not just to test this hypothesis, but
19 also the other putative etiologies that were proposed
20 that may have happened in 2007, and may even be
21 somewhat premature because right now we don't even
22 know that prevalence in cattle in 2007 changed

1 relative to previous years.

2 We don't have a systematic mechanism by
3 which we can sample cattle as they're presented for
4 harvest to evaluate what is the prevalence or load of
5 *E. coli* O157.

6 If we look at our research, where we've
7 done quite few studies, we look at the average
8 prevalence during the warmer months from 2001 to
9 2006, we see a typical range in harvest ready cattle
10 of 10 to 25 percent. And this is just purely a
11 prevalence in the fecal samples. We did a study in
12 2007, and the prevalence, at the time of harvest, was
13 7.3 percent but never exceeded 12 percent.

14 So this is just one single study. It
15 doesn't prove anything, but we certainly didn't see
16 any deviation from what we typically see. And in
17 this feedlot, it was similar to 2006.

18 So certainly we don't have the evidence
19 that actually prevalence increased at the moment. We
20 just don't have a systematic monitoring system that
21 is designed purposely to generate precise and
22 accurate estimates of prevalence.

1 But it does highlight the need or the
2 opportunity, if you will, that we have where we can
3 purpose design a sampling scheme, prospective
4 sampling scheme, so that we can estimate prevalence
5 with a relatively precise and accurate method. And,
6 certainly this purpose would not necessarily be micro
7 to identify individual feedlots, but we could think
8 about a macro purpose of the sampling scheme to
9 identify changes in prevalence or times of the year
10 when prevalence is particularly problematic.

11 So in that regard, I'd like to switch gears
12 now and move away from the speculative aspect of what
13 may or may not have happened in 2007, but talk about
14 what are the options moving forward. So what are the
15 pre-harvest controls that we can really think about?

16 And before I get into that, I'd like to
17 just focus a little bit on epidemiology principles,
18 and I'm an epidemiologist. I like to think about
19 things in fairly basic terms. And what we're really
20 measuring when we talk about *E. coli* 0157 is
21 prevalence. Oftentimes we talk about incidence,
22 incidence in cattle, incidence on carcass or

1 incidence in ground beef, but really what we're
2 talking about is prevalence.

3 And, prevalence is a proportion of a
4 population or a proportion of samples with a given
5 attribute at a particular time. And this is still
6 applicable even if we talk about load. So if we're
7 talking about colony-forming units per unit of
8 measure, per gram, per surface area, whatever it is,
9 prevalence is still applicable because we're really
10 looking at a percentage of the population that sit
11 above a certain characteristic.

12 And this is important because prevalence is
13 a function of two important attributes. Prevalence
14 is a function of incidence as well as duration of
15 infection. And, I'm only bringing this up because
16 that provides people two opportunities to change
17 prevalence. They can either target the incidence of
18 infection or they can target the duration of
19 infection.

20 They don't have to do both, and if they can
21 target one, then the outcome is going to be the same.
22 So if we can reduce incidence or duration, we will

1 reduce prevalence by definition. So in the grand
2 scheme of things, it's not important which one we
3 target because the outcome will be the same in that
4 we reduced the burden of *E. coli* 0157 and hopefully
5 we reduce it to an acceptable level.

6 And by acceptable level, it doesn't have to
7 be zero, and by that I mean on this cartoon that I
8 put together, we have cattle operations, each with
9 its own characteristic. These could be feedlots,
10 dairies, grass fed, organic, whatever it is. They
11 all supply cattle to packing plants that have varying
12 burdens of *E. coli* 0157, and then these cattle are
13 harvested and they go through a series of in-plant
14 interventions and we have the at-risk product or the
15 primary at-risk product, ground beef or trim for off-
16 site grinding.

17 And, certainly we can overwhelm the system.
18 It's not a fail-safe system. So theoretically the
19 burden on incoming cattle, whatever the
20 characteristic is, is so great we can overwhelm all
21 these interventions and ultimately have *E. coli* 0157
22 going out in ground beef or at-risk product.

1 So the purpose then is not necessarily to
2 reduce it to its lowest level, but to keep the burden
3 to an acceptable level.

4 So again, in my mind, the purpose of a pre-
5 harvest intervention is not to eliminate the
6 pathogen, because I don't think that's possible, but
7 the purpose is to insure that the burden of *E. coli*
8 O157 in cattle presented for harvest is within
9 acceptable limits such that the in-plant HACCP
10 interventions can effectively mitigate the burden on
11 incoming cattle.

12 If we accept this as the purpose of what a
13 pre-harvest intervention should be, then I think that
14 helps us when we start evaluating pre-harvest
15 interventions. And in this regard, it doesn't have
16 to be 100 percent effective because it is an
17 additional hurdle in a multi-hurdle system, and none
18 of the hurdles have to be 100 percent effective.
19 They just have to be somewhat effective to effect a
20 change at the end.

21 So the desired efficacy of the intervention
22 depends on two things. One is the burden on incoming

1 cattle and two is the pathogen-mitigation capacity of
2 the plant. And by that, I've done another
3 illustration to help understand that. The blue bars
4 represent the burden on incoming cattle without the
5 intervention. The red bars represent the burden with
6 the intervention. The horizontal dotted line
7 represents the plant capacity to deal with the
8 burden.

9 And, you'll see that the first scenario --
10 I've got four scenarios here. The first scenario,
11 the intervention has a 67 percent efficacy and
12 reduces the burden from here to below that threshold.
13 The second scenario is a 50 percent reduction. So we
14 reduce it from above the threshold to below the
15 threshold so that the plant can deal with it, and
16 then a 30 percent efficacy and then a 50 percent
17 efficacy.

18 What you can see from these scenarios is
19 that the first three scenarios actually move the
20 prevalence below it despite the fact they have
21 varying levels of efficacy. Whereas, this one which
22 is 50 percent does not. So I would argue that the

1 first three scenarios fit the purpose of what an
2 intervention should be whereas the last one doesn't
3 even though it has a greater efficacy in this
4 situation than one of the scenarios that do fit the
5 efficacy.

6 Unfortunately, we don't know what that
7 current threshold is. It's very poorly defined. So
8 what should we target when we're studying to evaluate
9 some of these interventions. And I think we can draw
10 from empirical data, where we could target wintertime
11 versus summertime type shedding patterns. And
12 certainly if we look at the human occurrences, this
13 is the number of reported cases, we have the years
14 going across here, and the gray bars represent the
15 warmest months, you can see that the reported cases
16 tend to increase every summer. It's not perfectly
17 aligned with the warmest months, but tends to be
18 associated with the warmest months, and we see that
19 70 percent of cases are reported in 6 months of the
20 year.

21 So certainly we have empirical data that
22 suggests that the burden on incoming cattle is more

1 likely to be within the pathogen capacity, mitigation
2 capacity of the plants during the cool months. So is
3 that something we can target?

4 And, I think we can, and we can also model
5 that. So there's some data that would help us here.
6 In 1999 and 2000, the USDA APHIS branch did a study
7 of 73 feedlots where they visited twice around the
8 year. They found that on average, the prevalence in
9 summer or warmer months was 68 percent, and in the
10 coolest months was 5 1/2 percent. So that gives us
11 an idea that there might be a 64 percent reduction
12 during the winter months.

13 Dave Smith, again from Nebraska, went in
14 the feedlot pens and sampled all of the animals in 44
15 pens in 5 different feedlots and found 30 percent
16 prevalence. And so this is what the pens looked
17 like, prevalence on the Y axis, pen on the X axis,
18 and he went back in winter and sampled 30 pens and
19 found now that the prevalence was only 6.1 percent.

20 So now we have some distributions that we
21 can plug into some mathematical model and evaluate
22 the effect of these interventions. And that's

1 exactly what Dave Smith has done based on his data
2 and his evaluation of interventions. He's found that
3 his intervention, sorry, not his intervention, but
4 the intervention he's been working on, averages a 65
5 percent efficacy. He believes that's pretty close to
6 being right but it's only a point estimate. There's
7 certainly uncertainty in that point estimate. So he
8 thinks it's at least 50 percent but probably not more
9 than 80 percent effective.

10 So we can build a distribution around that,
11 and then model that based on the distribution of the
12 data we have, and this is the output that he
13 generated from this simulation model whereas this bar
14 represents the summer with no intervention, and this
15 is the 30 percent mean that runs across it. This is
16 the prevalence on the Y axis from 0 to 100 percent.
17 Here is the winter with no intervention. So a lot
18 lower prevalence. But then this was what the summer
19 looks like with an intervention, and you can see that
20 we've moved the mean down to close to what it looks
21 like in winter but the distribution is even tighter
22 than what it looks like in winter.

1 And we can look at these data in a
2 different way. So the green bars represent summer
3 type shedding patterns. So this is prevalence 0 to
4 100 percent at the top. This is 0 percent of the
5 pens were at 0 percent. Sorry. This is percent of
6 pens here, and you'll see that most of the pens fall
7 in summer to the left of the mean, and then you have
8 quite a lot to the right of the mean. So we have
9 pens that are shedding 80 to 90 percent. Roughly 10
10 percent of pens are shed 80 to 90 percent *E. coli*
11 0157.

12 This is the wintertime shedding pattern.
13 So what we want to do with an intervention is make it
14 look more like this distribution, and we find that
15 when we apply the intervention during summer, we
16 simulate it. This is what we get and you can see, if
17 you compare that to this, or that to this, the
18 intervention looks a lot more like what it does in
19 winter than it does in summer.

20 So it looks like we can with certain
21 interventions produce an effect where we can
22 gravitate towards a winter type shedding pattern

1 relative to a summer type shedding pattern.

2 So now I'd like to present some field
3 efficacy of various interventions. Obviously there
4 are a lot more interventions. Some haven't taken to
5 field efficacy. That doesn't diminish their value
6 except that they haven't gone to being evaluated in
7 commercial feedlot settings yet.

8 Some interventions worked. I'll show you
9 that. Certainly some interventions don't work.
10 Unfortunately I don't have time to share those with
11 you but we probably should focus on those as well to
12 better understand why they didn't work.

13 So this table, and I'm sure some of you in
14 the back of the room are having trouble seeing this,
15 I'm sorry about that, is that this is looking at a
16 vaccine, the Bioniche product, and each section here
17 that's separated by a white horizontal line
18 represents a study. So they started in 2002 with one
19 study. There were two studies in 2003, two in 2004,
20 two in 2005, one in 2006. And what I am looking for,
21 as an epidemiologist, is an odds ratio less than one,
22 which means that the vaccine was somewhat protective.

1 And so I've highlighted that row, and it's the gold
2 row here, and basically what you can see is that
3 every one of these odds ratios is less than one. So
4 universally in every measure that they took, in every
5 study, in every year, there was a protective effect.
6 Sometimes it wasn't statistically significant. Other
7 times it was statistically significant. So it
8 certainly is protective and many times it is
9 significantly protected and these are the data that
10 fit into the simulation model. So the average
11 efficacy of this vaccine was 65 percent.

12 There is another vaccine that's under
13 consideration for licensing as well along with the
14 Bioniche product, and this is produced now by
15 Epitopix. These studies come from Dan Thomson from
16 Kansas State, and it's been evaluated in two years.
17 The first year was in 2006. I've got the prevalence
18 on the Y axis, the various measures on the X, feces,
19 rectal anal junction, a sign of colonization, as well
20 as what's on the hide. And, again we saw all the
21 odds ratios were less than one, but unfortunately in
22 this study none was statistically significant, and

1 this was because we had designed the study based on a
2 35 percent reduction. We saw more than that, but we
3 also based it on a 30 percent prevalence in a control
4 population, and you can see that the prevalence is
5 extremely low. So this study really lacked a lot of
6 statistical power.

7 We repeated the study with some
8 modifications in 2007, and these are the samples
9 based at the time of harvest. And, you can see
10 looking at fecal prevalence as well now fecal
11 concentration, that we significantly reduced both
12 fecal prevalence, the vaccine efficacy of 86 percent
13 reduction in shedding but not only that, those that
14 were still positive tended to be less positive, if
15 you will, in that those positive ones shed a lot
16 fewer bacteria than the positive ones that weren't
17 vaccinated. So we saw a 98 percent reduction in the
18 number of bacteria shed by positive animals. It
19 reduced the number as well as reduced the load within
20 those animals.

21 There's also been a lot of talk about
22 lactobacillus acidophilus, the strain NP51. This is

1 available to be used in cattle at the moment except
2 that it doesn't have any label claim for control of
3 *E. coli* O157, but there certainly has been quite a
4 bit of research to evaluate whether it can.

5 And this is a MEDA analysis I performed a
6 number of years ago. This red line represents no
7 effect. If it's to the left of the line, then
8 there's an effect. If it's to the right of the line,
9 then there's an adverse effect. And, you can see
10 that of these 13 studies, 12 of them were to the left
11 of the line and quite of them significantly. And
12 when we do the MEDA analysis, we come with this point
13 estimate which basically tells us that the product
14 has a 40 percent efficacy. So we can expect a 40
15 percent reduction in shedding in feces of cattle that
16 were fed this product, and I performed a similar MEDA
17 analysis of hide, and we would expect a 50 percent
18 reduction in contamination of hides in cattle fed
19 this product.

20 There certainly are a variety of other
21 interventions in development, evaluation or under the
22 licensing approval process depending on the

1 regulatory agent to which they work. They certainly
2 include sodium chlorate. We've heard a lot about
3 sodium chlorate. This is a suicide substrate for
4 facultatively anaerobic bacteria of which *Salmonella*
5 and *E. coli* are members.

6 And, it does appear to be very effective in
7 challenged studies. I didn't present results because
8 it hasn't got a slaughter authorization. So we can't
9 take it into field studies yet, but certainly we hope
10 to do that soon.

11 Bacteriophage technology and other
12 probiotics, competitive exclusion, I don't want to
13 diminish their value by not showing the results. I
14 was just focusing on what had been evaluated in the
15 field today.

16 So in summary then, certainly there's been
17 a lot of speculation about what, if anything,
18 happened during 2007. We can spend a lot of our
19 mental energy evaluating that but I think we have a
20 greater opportunity if we focus on moving forward.

21 We might not ever work out what happened in
22 2007, but we do know that pre-harvest control of *E.*

1 *coli* O157 in cattle is possible. The interventions,
2 to my mind, the data is overwhelming. We can effect
3 change.

4 No intervention, however, will be 100
5 percent effective but again I don't think it needs to
6 be. It certainly adds a hurdle in a multi-hurdle
7 system but it doesn't have to be 100 percent
8 effective if we use the empirical data as well as the
9 models that have been developed, it would indicate
10 that the pre-harvest interventions are both effective
11 but ultimately should turn a summertime type shedding
12 pattern into a wintertime type shedding pattern.
13 And, if we believe that that is associated with human
14 illness, ultimately some of these interventions
15 should reduce consumer exposure to *E. coli* O157.

16 Certainly, we're at a point where we have
17 vaccines under consideration by the Center for
18 Veterinary Biologics. We have feed additives under
19 consideration by FDA. So as soon as we can get those
20 approved or licensed, then we will have labeled
21 products available to us from which we can choose.
22 Right now we have the lactobacillus product but this

1 does not have a label claim supporting its use for
2 this challenge.

3 So I think we do have the opportunity.
4 Certainly challenge ahead of us, in development,
5 licensing approval. That certainly is a slow
6 process, but a deliberative process but I believe
7 these challenges are certainly not insurmountable.

8 Again, I would like to thank FSIS for
9 inviting me here. It really is an honor for me. I'd
10 be remiss if I didn't thank people who provided me
11 data and slides, Dave Smith, Dan Thomson and Nate
12 Bauer and Mindy Brashears is a collaborator with me.
13 She's a microbiologist at Texas Tech.

14 I presented you some studies that have been
15 funded. I should mention the funding, American Meat
16 Institute Foundation, the Beef Check Off Program,
17 USDA's NRI Program as well as Nutrition Physiology,
18 Bioniche and EpiTopix.

19 Again, thank you very much.

20 (Applause.)

21 DR. GOLDMAN: Thank you very much,
22 Dr. Loneragan for that survey of the pre-harvest

1 landscape. We appreciate that, and I'm sure it will
2 raise some questions and comments when we get to
3 that.

4 Next we'd like to invite Dr. Mandy Carr to
5 present. She's the Executive Director of Beef Safety
6 Research at the National Cattlemen's Beef
7 Association. She leads their Safety Strategy Team
8 which is a cross-section of the organization focused
9 on beef safety, and implements their safety research
10 program, and an approximate \$2 million budget to
11 address both pre-harvest and post-harvest beef
12 safety. This program coordinates the Beef Industry
13 Food Safety Council, which is a cross-section of
14 industry representatives focused on improving the
15 beef safety system. She serves as a liaison to the
16 Joint Beef Safety Committee of the Producers and the
17 NCBA's policy team related to safety research
18 information. Prior to her arrival at NCBA, she was
19 an associate tenured professor at Angelo State
20 University, and during eight years there, developed a
21 meat and food science undergraduate and graduate
22 teaching and research program, led the designing and

1 construction of the federally inspected Angelo State
2 University Meat Laboratory and led its operations.

3 So please welcome Dr. Carr.

4 (Applause.)

5 DR. CARR: Good morning, and again thank
6 you for the opportunity to be involved in these
7 conversations today. What I would like to share with
8 you from our perspective at NCBA and the work we do
9 with the Beef Check Off and Research is our
10 perspectives as well as some of the research
11 information. I'll build on some of the pieces that
12 Dr. Loneragan presented, and then also our
13 opportunities for moving forward.

14 If you look back over the course of the
15 Beef Check Off's involvement in beef safety research,
16 what you see is an approach that began many years
17 ago. The research part of the program only took
18 focus after the foodborne illness outbreak in the
19 Pacific Northwest in 1993.

20 At that time, the producer leadership
21 allocated money to investigate pathogen research. So
22 that focus was then developed and at that time, it

1 was determined that with the thousands and thousands
2 of cattle that are produced in this country, that
3 funnel through the system, the greatest impact at the
4 time could be made on developing interventions in the
5 post-harvest environment. So at this packer
6 processor level. So much of the research in the
7 beginning of the research program was directed toward
8 post-harvest interventions.

9 We know then those products are then
10 transferred into other portions of the sector retail
11 food service and then reach millions of customers.
12 So our efforts began in that sector.

13 If you look at this timeline, and I'll work
14 through it as I go through this presentation, but as
15 you can see that effort began in the early nineties
16 on post-harvest interventions and then that continues
17 today. We are still looking for new and effective
18 interventions for the post-harvest environment, but
19 we are also looking at opportunities that we can
20 optimize the ones that we currently have in place.

21 I will speak to the pre-harvest actions in
22 our outreach program in just a moment.

1 But if you look at the post-harvest
2 environment, the processing facility's ability to
3 impact pathogen load, the research has developed and
4 validated several different pieces, one of which is
5 the hide wash of the animal as it's coming onto the
6 processing floor. That can be with water at varied
7 temperatures but it can also be with water and with
8 chemicals, such as chlorinated water or other
9 chemicals that are proven safe that have an impact on
10 reducing microbial load.

11 Further research has looked at what
12 applications can be applied to the carcass once that
13 hide is removed. Several different pieces of
14 research were conducted and then turned into
15 interventions that are commonly utilized across the
16 country in processing facilities today.

17 One of those categories is the utilization
18 of sprays. Oftentimes these could be an organic
19 acid, such as lactic or acetic acid, applied at a
20 very low concentration, 1 1/2 to 2 1/2 percent,
21 applied in a cabinet like you see here on the left so
22 it sprays that carcass as it moves through the

1 processing floor. Other chemicals have been utilized
2 as well with similar effectiveness.

3 The next portion, when we looked at
4 controls beyond that, it's good to utilize
5 temperature to have an impact on pathogen load. And
6 what we've noticed is you can do that not only with
7 hot water in a cabinet system like you see on the
8 left, but utilizing steam, steam applied to spot
9 locations on the carcass where visible contamination
10 is seen or have the potential to be transferred.
11 Spraying steam on those locations and then vacuuming
12 that off.

13 The other application is steam
14 pasteurization or a thermal process which is depicted
15 in the picture in the upper right-hand corner. You
16 see that this is a multi-chambered piece and in the
17 first chamber you would have steam applied to the
18 whole surface of the carcass for a short period of
19 time, then moved into a second chamber where there is
20 a cold water spray to reduce that temperature back
21 down. We've seen each of these very effective.

22 So what you notice is, is this with other

1 interventions is done in what we call multiple hurdle
2 approach. Many of you've seen this depiction before
3 but we know from research is, is that a single
4 intervention has effectiveness, but when they are
5 combined in two or three or four together, then
6 they're even more effective. And as we put hurdles
7 in front of the pathogens, it becomes more difficult
8 for them to make their way throughout the system.

9 So with these many options available, what
10 this does is provide each facility the opportunity to
11 pick the interventions that best serve not only their
12 space requirements but the product in which they are
13 producing. So it's intended to have multiple options
14 so that it can be placed in the order which is the
15 most effective in each location.

16 So as we continue to work through that and
17 many other post-harvest interventions, in the late
18 1990s, the focus broadened to not only include post-
19 harvest intervention research but also to look at the
20 pre-harvest environment.

21 And as Dr. Loneragan presented earlier,
22 some of the work took into account many different

1 pieces. Initially, it was important to look at the
2 ecology of the organism in the pre-harvest
3 environment. Once we evaluated that and understood a
4 little bit better about the organism, work our way
5 into how could we affect it.

6 So the research then focused on some of the
7 key learnings, one of which is that we know that the
8 hide is the most likely source in which contamination
9 would then be transferred to the carcass.

10 So one piece that was learned is continuous
11 training of employees that perform this task so that
12 they understand their role is extremely important to
13 prevent that transfer and then will work into other
14 pieces such as the post-harvest interventions that I
15 described, become that much more effective.

16 If you take a step back up the chain or
17 back up the process, there are interventions that can
18 be utilized on the animal before it enters the
19 facility, one of which is using a live animal wash
20 which as you see, animals are in a pen and then spray
21 nozzles then release water in a shower formation
22 above the animals and also comes up underneath the

1 animals to wash them before they ever reach that in-
2 plant's interventions of the hide washes and others
3 that I just showed you.

4 If you take one step further back up the
5 line, we also look at the environment. As I said,
6 understanding the environment and the ecology of the
7 pathogens that are of interest, helps us better
8 understand how you can develop an intervention.

9 So one piece that was looked at is if you
10 look at the environment in which cattle are loaded
11 from a feedlot onto the trucks and then transported
12 to the processing facility, is there an opportunity
13 there to have some impact, and what we see from
14 several different studies, and I just picked one
15 slide to illustrate the point, is that if you took
16 air samples in those areas which are categorized as
17 clean or have a hard surface, one that can be washed
18 or water sprayed onto the soil, so that it doesn't
19 produce the dust like you saw in the pictures in the
20 previous presentation, you can have a significant
21 impact on the amount of O157 or *Salmonella* that would
22 then be in the air and can settle onto those hides.

1 So that is one step that can be performed from a
2 management standpoint.

3 One thing we know is if you take a step
4 back and go one step further up into the process, you
5 see that if you look at the prevalence not only in
6 feces but also on hides, to the point that was made
7 earlier, is animals shed this organism at a variable
8 rate, and it's not easy to predict.

9 If you look across these pens from this
10 study, across the top, 1 through 10, and then
11 sampling period goes down here on the left, you see
12 that, in particular, I just selected a few different
13 sites within the table, but if you look at Pen 5,
14 from one sampling period you had 7 percent of the
15 animals were positive. The very next time you had 83
16 percent positive. You can see similar other cases,
17 start out with 80 percent positive here, and the next
18 time 10 percent positive.

19 So that shedding pattern varies and it can
20 be seen not only in the fecal samples but also in the
21 hide samples. We sample the hides of those animals
22 and again you see the same thing going from 92

1 percent positive in one sampling to the very next
2 time of 11 and then down to 0. So it is not
3 something that is continuous in the shedding
4 patterns.

5 So what has been done through Check Off
6 funded research is to look at what are the options in
7 the pre-harvest environment that could have an impact
8 on the shedding or on the prevalence of the load of
9 target pathogens. And what the research has done is
10 looked at demonstrating effectiveness or validating
11 the researchable ideas that have been brought forth.

12 Many of these technologies, as was noted
13 earlier, are in the approval process or waiting to
14 start those field efficacy trials. However, I do
15 want to share with you a couple of the pieces and
16 expand on what you heard earlier.

17 The first is looking at the direct fed
18 microbials. Again, if you look at this study, and
19 this is one of many that have been conducted but if
20 you have a control, the bar up on the top or the line
21 on the top, and then two treatments with different
22 strains of lactic acid producing bacteria, you see

1 that there is a reduction in the prevalence of the
2 animals that were shedding O157:H7 compared to the
3 controls, about a 49 percent decrease.

4 If you look over four years, evaluating
5 this type of a compound, you can see from these
6 studies that continuously we see an impact where you
7 have reduced the percent positive animal shedding
8 O157 in a feedlot type of a setting.

9 Another category or topic that has been
10 researched has been the use of phages. These are
11 viruses that target specific bacteria, and they've
12 been widely used in Europe and in other countries as
13 alternatives to antibiotics. And so we see here,
14 that we're looking at the utilization of those to
15 invade a target bacteria but not impact the other
16 organisms that are helpful in responsible for other
17 functions such as digestion.

18 And what we see, and I just selected again
19 just one piece, though there are many, to show the
20 impact that we're seeing is there is about a 10-fold
21 reduction in animals that were inoculated with the
22 target organism and then those that received a

1 treatment versus those that did not. So again, an
2 impact that can be seen for a multiple hurdle
3 approach, the possibility in pre-harvest.

4 Additionally, to a point that was brought
5 up earlier, is the work that has been done through
6 the Check Off on sodium chlorate. Where phages
7 targeted a specific bacteria, chlorate is a compound
8 as was noted earlier that is considered a suicide
9 compound in that it targets a specific enzyme in
10 certain organisms, and it happens to be that two of
11 those target organisms that it's effective in are two
12 of the pathogens in which we like to address in the
13 beef industry.

14 So though it has not been cleared for the
15 field efficacy trials, in the controlled research
16 environment, we have seen some impact.

17 The white bars represent cattle that were
18 inoculated during a control study did not receive a
19 treatment. When you look at the yellow bars, these
20 are ones that received varying treatments with sodium
21 chlorate, and you can see that you have about a two
22 to three log reduction from those inoculated cattle.

1 So again a significant impact if utilized in a
2 multiple hurdle approach.

3 Another area of investigation has been the
4 utilization of Neomycin. This is a product that is
5 labeled for use in cattle, but it is not labeled for
6 its advantages in food safety in reducing O157:H7.
7 It is available in a form that can be easily applied,
8 whether feed or water, and it has a very short
9 withdrawal time that is easy to manage in the cattle
10 production study.

11 What you see, as was noted earlier, is a
12 reduction, and we just selected two different studies
13 here, and there were others, but if you look at the
14 O157 prevalence reduction, you can see in feces, it's
15 about a 98 percent reduction, hides about a 95
16 percent in the one study, and then in the second
17 study, very similar results again, in the utilization
18 of that in a level that can impact this target
19 pathogen.

20 You saw this graph earlier, so I won't go
21 into discussion of it, but when the technology for
22 vaccines began, we started looking at that technology

1 with Check Off funded research, the understanding
2 that the summer versus winter months were different
3 and if we could reduce summer to winter, that that
4 would be a significant impact in the pre-harvest
5 area.

6 Again, one of the studies that was
7 conducted and there have been subsequent since, is on
8 the technology from the Eptopix vaccine on the SRP
9 targeting a specific -- protein on the surface of a
10 target organism, and you can see again this advantage
11 over time to a lower percent positive of animals
12 shedding or have a fecal prevalence of 0157 as
13 compared to the control.

14 If you look that in subsequent research,
15 again this information shows about an 86 percent
16 reduction or efficacy and then again that
17 concentration, those that are positive, are positive
18 at such a lower rate as compared to those that did
19 not receive the treatment.

20 Other vaccines have been evaluated in our
21 program, and as was pointed out earlier, a different
22 vaccine, the one from Bioniche was evaluated and, as

1 you can see here, from this one graph, of animals
2 that received the vaccine versus those that received
3 a placebo, it's about 98 percent less likely that the
4 terminal rectal mucosal would be colonized by the
5 pathogen, and then those that did not receive that
6 intervention. So again, signs of success and
7 application in a pre-harvest environment.

8 This reiterates the point in that cattle
9 that were in one evaluation, where all the cattle in
10 the trial receiving a vaccine were placed in one pen,
11 another pen where no cattle received the vaccination,
12 and then a pen where half of the cattle received the
13 vaccination, and you can see 62 percent less shedding
14 for those that received the vaccine versus those that
15 didn't. And in that pen where it was mixed, still
16 was a decrease for those that received versus those
17 that did not, but there is a possibility that there's
18 some herd immunity or some advantages acquired by
19 some cattle in a pen receiving the vaccine and others
20 did not when they're housed together.

21 That being said, as our work through the
22 pre-harvest environment progresses, what we see is

1 that there are successful, validated research points
2 for interventions in both environments, and just as
3 has been the process for the post-harvest
4 environment, a multiple hurdle approach is what we
5 see as being of greatest success.

6 Again, we don't see anyone intervention
7 that can be commonly applied being the silver bullet
8 or to solve the problems, and we never expected to be
9 able to. It would be much more effective to have
10 multiple steps involved in a process to accomplish
11 the goal.

12 In saying that, the thing to keep in mind
13 is that the industry does not expect any of these
14 interventions to take the place of good manufacturing
15 practices which would include the sanitation and
16 cleanliness not only of the environment in the
17 production facility, the processing plant, but also
18 of that of the employees. We know that other steps
19 in the process, such as proper chilling within the
20 plant, provides an environment that bacteria do not
21 like to grow especially these target organisms. So
22 each one of those would never be replaced by any of

1 the new interventions that are developed. All this
2 goes together to provide the safest environment.

3 So now what I would like to show you is
4 where we're going. So we've looked at some
5 prospectives. What is the industry doing and where
6 are we taking our research program through the Check
7 Off?

8 What you see is the research priorities
9 that there were developed for 2007 fiscal year. The
10 thing to note about this is these are the projects
11 that are currently finishing up within the next two
12 to three months. What we did is we evaluated
13 different studies that addressed the several
14 different issues. Pre-harvest-wise, learning more
15 about the pathogen in its pre-harvest environment,
16 what is the impact of management practice changes and
17 other intervention technologies that can be evaluated
18 and if they show that they are effective, then how
19 can we move forward with those.

20 In the post-harvest environment, one of the
21 key pieces of research is looking at this sustained
22 activity in optimizing the interventions that we have

1 in place as well as looking for new ones that may
2 perform ever better than what we have.

3 A couple of pieces of key knowledge that go
4 to some of the questions that have been raised, one
5 is on non-0157. We have looked at that. We continue
6 to look at that but what we see is when over 10,000
7 samples have been collected for carcasses, trim and
8 ground beef, in that sampling there were only 15
9 isolates that machined the top 6 isolates from CDC of
10 concern, and only a fraction of those had the
11 virulence factors that would cause disease. So we
12 see 15 out of over 10,000 being the rate as we looked
13 across the country in different facilities. So I
14 think that's a key point to keep in mind.

15 To address some of the other questions,
16 one, distillers grains. Through our research, what
17 we've seen is was noted earlier, is there have only
18 been a few studies completed. That being said, there
19 are variations in the corn portion of the -- that's
20 in combination with the distillers grains. So I
21 think that warrants little bit more investigation
22 before a conclusion can be drawn.

1 As was noted earlier, the information from
2 last fall versus the information that was released
3 last week is not the same. So that to us notes that
4 there's a need for further investigation before a
5 real conclusion can be made.

6 In the area of multidrug resistant
7 *Salmonella*, considerable efforts have gone in this
8 direction, many studies. What we're seeing is if you
9 look across those studies, the strains that are being
10 shed by cattle in the feedlot setting are not the
11 same strains that have been involved in the cases of
12 illness for humans. So we continue to look at that.
13 We want to evaluate those items. Even more so, we
14 can monitor if there's any change.

15 One question that I would like to address
16 is when we got through these projects, we're not only
17 looking at targeting O157:H7, but we're looking at
18 the effectiveness of these interventions across other
19 pathogenic species because we want to know that the
20 interventions that are in place currently and those
21 that will be developed, have the ability particularly
22 in the post-harvest environment to impact and be

1 effective on other species. And so we've looked at
2 multidrug resistant *Salmonella*, non-0157 as well as
3 0157 and other *Salmonella* species and what we see is
4 each one of these interventions that have been
5 validated or in place, are effective on these others
6 as well. So it's not that we're targeting just 0157
7 with interventions in a plant.

8 The other priority that we have with the
9 research program is to foster the environment that is
10 built by the Beef Industry Food Safety Council, and
11 you'll hear a little bit more about that organization
12 in a moment, but what that group is, is a cross-
13 section of individuals throughout the industry from
14 producers, processors, retail food service, that come
15 together and on an annual basis attend a meeting
16 called the Beef Industry Safety Summit, and not only
17 at that time do they hear the most current
18 information and research results, but they also
19 address up and coming challenges that they see in the
20 industry.

21 The other piece that occurs at this time is
22 there is a series of best practice documents BIFSCo

1 has put together and each year reevaluates those,
2 make sure they are up to date and include the latest
3 information, and that group, with their knowledge,
4 then re-issue those, and they're posted to the
5 website you see here, bifsco.org. Those are posted
6 there for anyone to access. They are distributed
7 free. So there is no charge for those documents for
8 anyone to utilize those as the basis for developing
9 their production practices to produce the safest beef
10 possible.

11 Aside from the outreach we do with BIFSCo,
12 we also have a website, beefresearch.org, which has
13 project summaries from all the research that we
14 conduct, fact sheets, the executive summary, not only
15 from the Safety Summit, but from our annual research
16 reports. So anyone can log onto this at anytime.
17 You can also request a printed copy if you would
18 prefer, to see what information is being collected
19 and what those research results are so that the next
20 evaluations can be based on science that is produced
21 not only through the Beef Check Off but through other
22 organizations as well.

1 I just want to give you a little snapshot
2 of where we're going next. As I said, the '07 fiscal
3 year projects are in the process of being completed.
4 We'll have more information in some of those areas
5 soon. But in 2008, these projects will complete in
6 May of '09, and similarly to what you saw before, we
7 continue investigation in some areas but we also have
8 expanded that a little bit beyond what we did in
9 2007, to include other emerging pathogens that we
10 want to make sure that we understand and their role
11 in the beef environment, and then also looking at the
12 develop of resistance so that we can understand that
13 category a little bit better.

14 Post-harvest, we're looking at the
15 opportunity to survey the use of the best practices
16 throughout the industry and build up on the knowledge
17 so that we understand also what audiences do we still
18 need to reach with these documents and provide the
19 service to them. Looking at the risk assessment for
20 other products as well as the continual investigation
21 to optimize the in-plant interventions that we have.

22 For monitoring, the research that goes on

1 across the world, though we may not be involved in
2 every particular aspect of the research, we want to
3 make to sure that we're abreast of that that's being
4 monitored by others, and then again, our BIFSCo
5 initiative has not only maintained what we do by
6 having a Safety Summit in that outreach, but we're
7 building beyond that. To do cooperative work on
8 small plant outreach, to take those best practices,
9 turn them into a format which may be of value, such
10 as the production of a video.

11 Our first video is on the N-60 sampling
12 procedure, and that will be distributed before the
13 end of the month. And the purpose for that is to
14 take a document that is extensive and very detailed
15 and put it into a format that can be easily
16 understood and utilized by not only in-plant
17 personnel that are taking the samples for that
18 procedure, but also to be utilized by others involved
19 in taking sampling procedures for these microbial
20 tests.

21 Again, we continue our efforts for outreach
22 in our publications, through out websites and printed

1 documents.

2 And that being said, what you'll notice
3 then is this work not only in the pre and post-
4 harvest environment and research, but also strive to
5 have the outreach so that the information that is
6 gathered doesn't just stay in our office. We want it
7 to be distributed to the industry and to others who
8 need to utilize it for decision making processes, so
9 they have the science to do that with. So over time
10 you can see the development of task forces, the
11 organizations such as BIFSCo, the hosting of the
12 Annual Safety Summit, the development of those best
13 practice documents and the video, and each one of
14 those progresses to include new and upcoming topics
15 each year.

16 So with that, I'd like to thank you for the
17 opportunity to be involved in these conversations
18 today, not only from the Beef Check Off Program side,
19 but also from NCBA and our work through the safety
20 research. Thank you.

21 (Applause.)

22 DR. GOLDMAN: Thank you very much,

1 Dr. Carr.

2 Our last presenter on this panel as I
3 mentioned is a pinch hitter. Dr. Dean Danielson is
4 currently the Vice President for Food Safety and
5 Quality Assurance of Tyson's Food for the last six
6 years, and is responsible for all of the food safety
7 and quality assurance program for red meat, poultry,
8 processed meats and their international divisions as
9 well. He was formerly a professor at Auburn
10 University and has his Bachelors in Animal Science
11 from Iowa State, a Master's in Animal Science and his
12 Ph.D. both from Virginia Tech. And he has numerous
13 industry affiliations and will share with us his
14 perspectives on interventions that may be applied
15 maybe both pre and post-harvest.

16 DR. DANIELSON: Well, I appreciate that. I
17 am a veteran of more than six years. Prior to
18 Tyson's, I was with IBP 20 years, but I appreciate
19 the opportunity to come up here and fill in for Bo or
20 pinch hit as you said.

21 I've got two memorable highlights of this
22 trip. One is, of course, the meeting, and the other

1 one is the baseball game that I went to last night at
2 the brand new stadium. It's just a beautiful,
3 beautiful stadium, and we watched some great baseball
4 last night, and even though your local team, you guys
5 are very fortunate that live in town here, to be able
6 to go out and see some great baseball when these
7 other teams come in to play and some great players.
8 You've got a chance to see some great baseball.
9 Unfortunately, we didn't come away with a win last
10 night, but I'm a Cubs fan, so I'm used to that.

11 (Laughter.)

12 DR. DANIELSON: But as I was sitting there
13 last night, thinking about this and after having a
14 couple of little adult beverages and a great hot dog
15 by the way, the baseball analogies came to my mind
16 last night and this morning about what I saw last
17 night and what was going on and what we're doing
18 here. The pinch hitter comes to play. As I was
19 sitting up here this morning and watching out in the
20 audience and some great talks here, but I saw a
21 couple noddors going out there, and when I get done
22 talking here, there's going to be more. The --

1 stretch is going to be very important for this group.

2 Looking at that field last night, every
3 base had an umpire standing there watching what was
4 going on, watching every move, making sure that the
5 plays were made right and there were coaches at the
6 bases, and that reminded me of our FSIS inspectors
7 out in our plants and facilities watching what we're
8 doing.

9 The behind-the-plate empire, calling the
10 strikes and calling the balls and making the game go.
11 Almanza came to my mind. And then the Commissioner
12 of Baseball sitting right here in front, Rich
13 Raymond, and then we've got the great closer, Stan
14 Painter (laughter), the great closers in the game
15 right here in front of us.

16 I saw great plays and great players. Two
17 teams opposing each other but they have the same
18 goal, yeah, you win some and you lose some but the
19 same goal, and that's to make a great game and work
20 together as a team to make it happen because it's the
21 fans up in the stadium that are the ones that are
22 there that making the reason for that. And the

1 stadium wasn't full last night. It wasn't a sellout.

2 So we're the players. Everyone in this
3 room is a player. We've got coaches. We've got
4 agents. We've got base players, but we're
5 responsible for making the game go, and if we don't
6 play a good game, we're never going to have a sell
7 out, and then the game won't go on. So I saw a lot
8 of great analogies and the baseball season and it's a
9 great opportunity to go out there. So I share that
10 with you.

11 I'm going to read to you a BIFSCo statement
12 or a letter that was prepared for this meeting and
13 then it will be submitted into the meeting inputs,
14 and that is my pinch hitting effort for Bo Reagan
15 today. It's a statement of the Beef Industry Food
16 Safety Council members, presented April 10, 2008,
17 Washington, D.C.

18 Food safety is nothing new to the beef
19 industry. Beef safety is more than an expectation,
20 more than an effort of any one single entity, and it
21 is the sum of the entire beef production system from
22 farm to table.

1 The industry and the scientific community
2 realize that further improvements can e made through
3 a collaborative effort. The beef industry believes
4 that the optimal system of food safety assurance
5 relies upon a food safety net extending from farm to
6 consumer.

7 To this end, the Beef Industry Food Safety
8 Council or BIFSCo is composed of industry executives,
9 beef producers, university, Government and industry
10 scientists, industry association executives and
11 experts that represent each segment of the beef food
12 chain. This cooperative effort clearly displays a
13 deep commitment for further action to enhance the
14 safety of the beef supply. These enhancements can be
15 made through a collaborative effort based upon
16 several factors.

17 One, the use of science-based pathogen
18 intervention strategies which we have been looking at
19 in these talks to enhance sanitary processes that
20 include effective HACCP programs and microbiological
21 testing protocols that verify process control.

22 BIFSCo's best practices have been in place

1 since 2003 and are available for all segments of the
2 beef industry for use, free of charge, and can be
3 accessed on multiple association websites.

4 Experts are available to assist with
5 technical questions. The documents are dynamic and
6 continuously updated to include the latest science
7 and technology. The most recent best practice
8 document produced was Best Practices for
9 Microbiological Sampling, and this document will
10 assist with the industry-wide use of the N-60
11 sampling protocol. In addition, a demonstration or
12 video will soon be available for use in training
13 personnel.

14 Second, an understanding shared by each
15 segment of the beef food chain of the risks involved
16 and the steps needed to insure safe beef experience.
17 The Annual Beef Industry Safety Summit provides the
18 opportunity for information sharing among all
19 industry sectors as well as discussion on current and
20 emerging safety challenges.

21 Three, the principles of prevention and
22 risk from farm to table, including effective

1 monitoring of intervention strategies. These
2 strategies must be based on data collected through
3 research. The best practices developed by BIFSCo and
4 embraced by industry follow this model by inclusion
5 of interventions and systems validated through
6 research. Next.

7 The notice for today's meeting included the
8 statement, "FSIS will discuss growing evidence that
9 may support a determination that while beef products
10 such as primal cuts and boxed beef contaminated with
11 O157:H7 are adulterated.

12 Based upon available research, the
13 prevalence of O157:H7 on the surface of sub-primals
14 is rare. In two studies funded by Beef Check Off,
15 examining over 1,000 and in the second study, beef
16 samples from multiple processing facilities, the
17 incidence of O157:H7 on the surface of a sub-primal
18 was 0 in the first study and only 2 in the second
19 study. The levels of O157:H7 in the two positive
20 samples in the latter study were less than .375
21 colony forming units per centimeter square.

22 The results indicate that O157:H7 is not a

1 common contaminant on the surface of sub-primals and
2 that if it is present, it is at extremely low levels.

3 Next.

4 The expansion of the adulteration policy
5 for O157:H7 to all intact beef products is not
6 warranted due to the lack of supporting scientific
7 evidence and because interventions and processes
8 exist for application to such products entering
9 further processing. Steaks and roasts from intact
10 beef have not been implicated in foodborne illness.

11 Existing regulations and policies and
12 industry best practices are currently in place to
13 address the use of trim intended for ground beef
14 production from intact primals. Existing policies
15 and industry best practices that effectively address
16 the hazard for O157:H7 are also in place for non-
17 intact beef primals.

18 These facts, combined with research, that
19 indicates the very low prevalence and very low
20 quantitative levels found on the surface of intact
21 primals show that this policy expansion is not
22 warranted. Next.

1 The expansion of the adulteration policy
2 to all non-O157:H7 STEC is also unwarranted based on
3 data that exists as a result of the most current
4 research. This position is based largely upon the
5 scientific literature and on the public health data
6 studies that have been conducted to determine
7 prevalence and characterization of non-O157 STECs on
8 pre and post-intervention carcasses and in ground
9 beef. 10,159 samples composed of carcass trim and
10 ground beef were analyzed and only 50 isolates
11 matched 1 of the top 6 CDC STEC serotypes. A
12 fraction of these have the ability to cause disease.
13 This data does not support making all STECs
14 adulterants in raw ground beef.

15 At the public meeting held in October of
16 '07, CDC reported though outbreaks linked to non-O157
17 STECs from beef. The scientific literature clearly
18 indicates that not all serotypes of STEC are
19 pathogenic to humans and much is still unknown
20 concerning virulence factors and their relationships
21 to human disease.

22 FSIS has no published validated and

1 accepted laboratory protocol for determining
2 pathogenic STEC in beef and many analytical changes
3 remain related to adopting laboratory methodology for
4 industry use.

5 Given these facts, declaration of all non-
6 O157 STECs as adulterants is not technologically
7 feasible, nor would it be a wise use of food safety
8 resources.

9 The best course of action is for industry
10 and Government to continue targeting O157:H7 with
11 validated interventions and appropriate testing since
12 this is the serogroup that is most virulent and most
13 often associated with severe human disease and
14 outbreaks.

15 Broad spectrum interventions currently in
16 place will have a correlated effect on the other
17 serogroups beyond O157. This was demonstrated at
18 study conducted by USDA scientists that showed a 7-
19 fold reduction in carcass contamination by STEC
20 through the use of existing interventions. Next.

21 Plant reassessments were recently conducted
22 which resulted in many changes to plant processes and

1 policies. The effects of these changes therefore can
2 not be evaluated since results from these adjustments
3 have not yet to be measured. The use of data to
4 track microbiological trends is a valuable tool used
5 by the beef industry but this tool must utilize data
6 that is collected over time and is not effective when
7 used as a snapshot view of a situation.

8 We must allow the enhanced systems to
9 operate for a substantial period of time before
10 Judgment is made on the effectiveness or need for
11 changes.

12 Review of the PulseNet and CDC data does
13 not show a public health crises for beef-related *E.*
14 *coli* O157 illnesses in the past year. In fact,
15 review of the trends in FoodNet data from CDC, shows
16 a dramatic and impressive downward trend since the
17 baseline years of 1996 through 1998. This downward
18 trend is no accident. Of note, the alarm sounded by
19 FSIS in late 2007, due to increased incident rates
20 and associated increase recalls, really probably
21 should have come as no surprise. Both FSIS and
22 industry have been making critical improvements in

1 beef sampling techniques, changes in laboratory
2 methods that increased detection, sensitivity and
3 accuracy, and implementing more comprehensive
4 programs and procedures for surveillance and
5 prevention.

6 Again, it is no surprise that there was an
7 increase in samples positive for O157:H7 and
8 associated recall outcomes based on these findings.
9 In fact, this is exactly what should have happened in
10 light of the system improvements that were deployed
11 in the last few years. The increase in FSIS positive
12 samples is not due to unknown disturbances or
13 industry back sliding but rather is a function of
14 system enhancements. Additional regulations are
15 unjustified.

16 Beef safety has been and will continue to
17 be a dominant feature of the beef industry. However,
18 food safety cannot be addressed without considering
19 the road that beef makes to the consumer's table.
20 The food chain begins on the farm and extends through
21 processors, distributors and ends with the retail and
22 food service establishments having direct contact

1 with consumers.

2 While important food safety trends are
3 impacting the entire beef production system, the
4 final dimension insuring beef safety takes the form
5 of optimizing the use of interventions and control
6 points not only within individual segments but within
7 the entire system from top to bottom.

8 For these reasons, the entire beef industry
9 is committed to enhancing the current science-based
10 industry-wide approach. Every segment of the beef
11 industry is united behind effective programs designed
12 to solve microbiological problems, including O157:H7
13 in the beef supply and aimed at long-term solutions
14 for the problems presented by other hazards. Already
15 existing are those that may evolve and present
16 themselves in the future.

17 So in summary, expansion of the
18 adulteration policy to include non-O157 STECs is not
19 warranted.

20 Two, expansion of O157:H7 adulteration
21 policy to include intact beef products is not
22 supported by science.

1 Three, effects of recent applications of
2 new technology and knowledge must be evaluated after
3 an appropriate period of data collection.

4 Four, the beef industry is committed to
5 enhancing current systems using a science-based
6 approach.

7 The beef industry is committed to working
8 with FSIS to discuss safety frameworks in the context
9 of sound science.

10 This letter from BIFSCo representing the
11 farm to retail production and distribution of beef
12 welcomes the participation of USDA officials
13 representing Government's responsibility to provide a
14 regulatory framework for food safety, to work
15 collaboratively on improvements that are science
16 based and technologically feasible.

17 Again, we strongly believe that there's no
18 evidence at this time to support new regulatory
19 determinations with respect to adulteration of beef
20 products.

21 This letter is signed by numerous BIFSCo
22 members and will be submitted into the notes. Thank

1 you very much.

2 (Applause.)

3 DR. GOLDMAN: All right. Thank you,
4 Dr. Danielson.

5 We're right on schedule. We have time now
6 for your comments or questions for this panel, and
7 we'll start with Dr. Raymond.

8 DR. RAYMOND: Commissioner. I enjoyed your
9 analogy, but there's a few things you could have gone
10 just a little bit further. For instance, you forgot
11 the injured reserve list over here with Loren Lange.
12 Just because he confused you with Randy yesterday,
13 you still can't not ignore his presence in the room.

14 And Dr. Loneragan and Dr. Carr referenced a
15 couple of times something that we know, that the warm
16 months have a higher prevalence of *E. coli* 0157 both
17 in human illnesses and in sampling. But we can start
18 off with warm months, perhaps, Dean, you should
19 recognize that as baseball season is a high
20 prevalence season and in baseball when we have spring
21 practices getting ready for the season, this meeting
22 may be kind of like a spring practice because as we

1 get together and practice or learn together, share
2 things, hopefully we'll commit few errors and hit
3 more home runs during the baseball season.

4 That said, I have a couple of things, Dean,
5 I do need to respond to your letter.

6 We did not change our sampling reagents
7 this last year. So it was a surprise to use that the
8 positives came in higher than they had for the last
9 three years. We did initiate a new substance, an
10 enhanced broth in January of '08, but last year we
11 were still using the same old broth. Industry, yes,
12 had instituted that change quicker than we did but
13 most of the recalls were due to our testing. They
14 weren't due to industry and those may have been
15 missed in previous years. We will certainly give you
16 that. And we may very well see an increased product
17 sampling positives this year on FSIS samples because
18 of both the format has been changed of what we sample
19 and who we sample but also how we sample. So we
20 should be careful when we compare apples to oranges,
21 that we are consistent. I will agree with you on
22 that wholeheartedly.

Free State Reporting, Inc.
1378 Cape St. Claire Road
Annapolis, MD 21409
(410) 974-0947

1 What I would ask industry to consider,
2 about 20 percent of the samples that we did last year
3 were not held. They were distributed into commerce
4 and then we did have to recall those 11 positive
5 samples and it would be nice if we were able to
6 figure out ways for the small and very small
7 processors to hold that. I realize there's physical
8 issue or space issues, but if we could work together
9 on that also, that would cut our recalls down in
10 half, and we would have less tainted product out in
11 commerce. So that's another way we can hopefully
12 come to some solutions and visit with industry about
13 that area.

14 So with that said, I appreciate all of the
15 comments that we heard today from the three folks.
16 I'll get away from the microphone so those who have
17 serious questions can answer them.

18 I look forward to the next panel also who
19 have a more diverse representation to give us some
20 other ideas.

21 DR. GOLDMAN: Okay. Thank you.
22 Ms. Nestor.

1 MS. NESTOR: Felicia Nestor, Food and Water
2 Watch. Dr. Raymond actually anticipated one of the
3 questions. I was not aware that FSIS did anything
4 differently in the testing between 2006 and 2007 to
5 go from 20 positives in 2006 to 29 in 2007. And I
6 just wanted to ask, is it Dr. Danielson or
7 Mr. Danielson, do you agree with that, that FSIS did
8 not, and if not, can you tell us what they did so
9 that it might explain the 20 to 29 in the one year?

10 DR. DANIELSON: I am not totally able to
11 talk to that.

12 MS. NESTOR: Okay.

13 DR. DANIELSON: And so I would defer you to
14 what Dr. Raymond said.

15 MS. NESTOR: Okay. Thank you. That's one
16 question. I was asking FSIS some questions yesterday
17 about N-60 and they didn't know some of the answers,
18 and so I realize, you know, you're as we say pinch
19 hitting. So you may not, and some of these are
20 detailed, and if you don't know the answers, maybe
21 somebody else can tell me later.

22 Do you know in a large plant about how many

1 combos of trim are produced per day ballpark to go
2 with the baseball analogy?

3 DR. DANIELSON: A large plant --

4 MS. NESTOR: I mean are we talking 20 or
5 we're talking 200?

6 DR. DANIELSON: 4 to 500.

7 MS. NESTOR: 4 to 500 combos of trim.
8 Okay.

9 DR. DANIELSON: That's a big plant.

10 MS. NESTOR: Okay. And do you have any
11 idea what the range and the mean would be of how many
12 combos, if you're testing each combo, which
13 apparently that's what the industry is doing now is
14 testing each combo, do you have any idea how many
15 combos per day might be diverted to cooking? I mean
16 I'm sure that many days it's probably zero, but
17 what's the most that you've heard of in a day?

18 DR. DANIELSON: Well, I only have my own,
19 you know, my own experiences so I'd have to do some
20 ciphering here on that. I don't have it off the top
21 of my head. I'm sorry.

22 MS. NESTOR: Okay. Maybe before the end of

1 the meeting. I mean again ballpark is fine by me.
2 Is it, you know, is the mean 5 or is the mean 20?

3 Can you tell us when the industry started
4 testing one combo at a time using N-60 as opposed to
5 five combos at a time?

6 DR. DANIELSON: The industry has not
7 collectively done that. It's a movement or it's a
8 discussion. Some are doing it. Some are still in
9 the five combos grouping, and that is a very, very
10 new process of discussion as laboratory capabilities
11 are being advanced and improved, and the sampling
12 technologies are being advanced and approved. That
13 is not across the board yet, and may, you know, it's
14 not a requirement across the board.

15 MS. NESTOR: Right.

16 DR. DANIELSON: So that's new development.

17 MS. NESTOR: Do you know when some started
18 it? Was it in 2007 or has this been starting since
19 2003?

20 DR. DANIELSON: This, to my knowledge,
21 would have been started back in '07 sometime, during
22 the year of '07.

1 MS. NESTOR: Okay. Final question. Do you
2 by any chance happen to know what the confidence
3 level is if you're doing N-60 and the defect rate is
4 not 5 percent but 1 percent? I realize this is
5 incredibly technical.

6 DR. DANIELSON: Yeah, you're going to have
7 to -- it's a -- at a 1 percent level, it takes to my
8 understanding 300 plus N to get a 95 percent. And
9 that may not be exact. Somebody that's a better
10 statistician maybe could answer that but that's my
11 recollection.

12 MS. NESTOR: Okay. And so N-60 would give
13 us somewhat less, maybe much less than 95 percent
14 confidence?

15 DR. DANIELSON: If your population was at
16 -- statistically your population was at 1 percent,
17 it would be less than 95 percent.

18 MS. NESTOR: Okay. And then if it's at .2
19 which is what the Agency's prevalence shows, it would
20 be even less than that.

21 DR. DANIELSON: If that is what the true
22 prevalence is.

1 MS. NESTOR: Okay. Thank you.

2 DR. GOLDMAN: All right. Thank you.

3 Before we continue here, let me check with our
4 callers on the phone. Do we have any questions,
5 operator?

6 (No response.)

7 DR. GOLDMAN: Okay. We'll go back here.

8 MR. WALDROP: Chris Waldrop, Consumer
9 Federation of America. I just had a comment.
10 Dr. Danielson in his reading the letter mentioned
11 that there had been significant progress in reducing
12 *E. coli* since the '96, '98 baseline according to CDC
13 numbers, and while I agree with that, the problem I
14 think is that most of that reduction happened in the
15 early years and since about 2001, we haven't really
16 seen the big reductions that we need to. And so kind
17 of knowing that that's the situation, I applaud the
18 Agency for trying to look at this problem broadly and
19 in a proactive stance.

20 I had a couple of questions. One for
21 Dr. Carr. You mentioned the multiple hurdle
22 approach. Obviously we know that that works in the

1 post-harvest, and you mentioned that it's likely to
2 work in the pre-harvest. Has there been research
3 done that put some of these pre-harvest interventions
4 together to see how effective they are in pre-
5 harvest?

6 DR. CARR: Through our programs with the
7 Beef Check Off, we have not but when those approvals
8 are gained and we can test these in a commercial
9 setting, large scale, and we would like to approach
10 that, but we can't do that yet.

11 MR. WALDROP: Great. That brings me to my
12 next questions for all three panelists. If you can
13 expand on the barriers to implementation, why are
14 there limitation of these pre-harvest interventions,
15 and maybe, you know, looking at it, I think
16 regulatory implementation, economic, research
17 barriers, all those barriers, and then what your
18 opinion is on how we can overcome some of those
19 barriers? Because I think most of us in the room
20 would agree the pre-harvest is an important place to
21 focus in addition to what we're already doing, but
22 obviously there's some barriers to moving forward. I

1 would be interested in your perspective on that.

2 DR. LONERAGAN: Well, I think the first
3 barrier that we have is licensing and approval of
4 product. If we want product that has a label claim
5 that says that it's been evaluated by a regulatory
6 agency, it says if you follow these procedures with
7 this product, you can expect this outcome. Right now
8 we don't have any product that is labeled that way.
9 There are at least two vaccines that are under
10 consideration by the U.S. Department of Ag, Center
11 for Veterinary Biologics, and there is at least one,
12 probably more, under consideration by the Food and
13 Drug Administration.

14 The challenge is that the regulatory
15 approval is slow and deliberative. It's a new use
16 and a new approval process. They haven't approved
17 food safety type products like this in cattle before
18 and so what are the standards to set by which they
19 should evaluate these, it's just not known right now,
20 and unfortunately that's hold up the process. So
21 that is the first limitation to implementation right
22 now, is that they're just not being approved or

1 licensed depending on which agency.

2 When you get to the second one, as in the
3 economic cost, I really don't want to speculate about
4 what's going to happen once these get into the
5 market. I think we let the market work out where
6 they fit, who can use them, who can share the cost,
7 can we add value by using these in certain
8 situations, but until we get the approval of these,
9 we can't evaluate them. We can't let the market
10 force us to work out how they're going to be used and
11 who's going to use them, and bear the cost of --

12 MR. WALDROP: And as part of the
13 implementation, part of the regulatory approval, the
14 fact that there's not enough research out there or do
15 you feel that there's significant or enough research
16 to be able to move forward on the regulatory side?

17 DR. LONERAGAN: I can't really speak to the
18 FDA's side as much, but I can speak to the vaccine
19 side. To me the data, I believe there is an effect.
20 That effect is consistent over time. They provide
21 evidence, overwhelming evidence that immunomodulation
22 is an effective way that we can reduce prevalence.

1 That's a different question than is that reduction
2 sufficient to warrant implementation. I think that's
3 what the Agency is struggling right now with is I
4 don't think they have a question about effectiveness.
5 I think they have a question about is that
6 effectiveness big enough that warrants them
7 implementing it? I would argue yes, but that process
8 is a slow process.

9 MR. WALDROP: Thank you.

10 DR. GOLDMAN: Thank you. Next.

11 MR. LOVETRO: Yes. My name is Dave
12 Lovetro. I'm with Eka Chemicals, Incorporated. Eka
13 is a manufacturer of sodium chlorate, so a
14 stakeholder in the pre-harvest intervention, part of
15 the toolbox.

16 I just want to make a comment about pre-
17 harvest and this is a perfect place in line I think
18 based on the last speaker here. Some of the issues
19 and some of the hurdles, for a perspective of what it
20 takes to get a product from conception into a
21 commercial pipe or marketplace, you know, it really
22 goes in three important circles. There's a science

1 and a technical circle, and we've certainly heard a
2 lot of good information on that today. It also moves
3 in a commercial business circle in terms of business
4 people like myself who look at products and try to
5 decide whether or not it's a good investment. I'm
6 happy to say in this case, in Eka's case, that we
7 certainly believe that the pre-harvest types of
8 products, the one we're looking at for our own
9 company is imported. We've invested alongside people
10 like USDA, ARS, who has been our greater partner over
11 the past years. Now Eka is a licensee of the
12 technology. So we continue to invest.

13 I'm happy to say that from the beef
14 industry perspective and the pork industry
15 perspective, we have had good investment on the
16 science side from people like NCBA, the National Pork
17 Board. So I think the science or the technical piece
18 goes along very, very nicely.

19 But there's an important piece that the
20 last gentleman at the microphone was speaking about,
21 and that is the fact that pre-harvest interventions
22 will be regulated products of food animals, and it

1 depends on what kind of an intervention it is. In
2 some cases, you're talking about natural biologics,
3 which is one regulatory agency. In some cases you're
4 talking about food additives, feed additives, or
5 veterinary drugs which is another agency.

6 I'm a little bit more conversant on the FDA
7 side because that's my particular situation with a
8 product that's probably is a feed additive which
9 actually is a human food safety initiative. Eka's no
10 stranger to the regulatory process and I can't speak
11 on the terrestrial side but we have done some work
12 with food animals on the aquaculture side which is
13 the fish market.

14 I was interested to hear it presented at an
15 aquaculture meeting. The average time it takes to
16 move product through, in the worst case, a veterinary
17 drug scenario, as an original animal drug application
18 in this country is 12 years. So that means there's a
19 stakeholder out there today, if they start today, we
20 should probably be looking for something coming out
21 of the end of the pipe at 2020.

22 Now obviously we're all stakeholders. I

1 have a family. I'm interested in food safety as much
2 as anybody else. 2020, you know, to wait that long
3 is just too long.

4 So I would put my pitch in for all the
5 stakeholders here from the consumer side, from the
6 science side, from the industry side, if you're
7 looking for a place to put some energy, the system as
8 we have it today, moving through the regulatory
9 process, is a little bit too slow, and I would
10 encourage, and I would be encouraged myself if we can
11 find the strategies through a partnering effort or a
12 collaborative effort to find a way to work with the
13 regulatory agencies to improve the timeline process.
14 It's an important aspect of it.

15 And I think that if there's a way, you
16 know, I'm encouraged to see that there are science
17 people here today. I'm encouraged to see that at
18 least from the business side, perhaps there are some
19 people but it would have done my heart good to know
20 that perhaps there might have been someone here from
21 the regulatory side who was listening to this and
22 realizing just how important these products are and

1 how important a piece that they play in that
2 timeline.

3 DR. GOLDMAN: Thank you. Any comments
4 from -- okay.

5 DR. DANIELSON: I agree.

6 DR. GOLDMAN: Thank you. Yes.

7 MS. DONLEY: Hello. I'm Nancy Donley from
8 STOP, Safe Tables Our Priority.

9 I want to start off by mentioning that all
10 organization represents foodborne illness victims
11 from many, many sources of foods, and foods that have
12 been contaminated by *E. coli* 0157. Outside the beef
13 industry, we have had victims suffer from
14 contaminated juice, lettuce, other produce,
15 cantaloupes. We've had victims who have become ill
16 from drinking water and as well as swimming in
17 contaminated reservoirs.

18 If you want to do the epidemiology on this,
19 and you take these illnesses and you take them back
20 far enough, many, many times you're going to bump
21 into a cow. So this issue is bigger than just the
22 beef industry, and I think the associations here have

1 to recognize that, that not only are you thinking
2 that you just need to get an animal into better
3 pathogenic condition when it enters the
4 slaughterhouse facilities, it's a bigger problem than
5 that.

6 We've been advocating since our inception
7 for the need for much more pre-harvest interventions,
8 that it is necessary for these very reasons that I
9 specified before. So we are very interested in
10 anything and everything that you all are working on
11 specifically.

12 Dr. Loneragan, I was very interested to
13 hear your suggestion that a design sampling scheme be
14 prevalent in cattle being presented for harvest. We
15 fully support something like that because right now,
16 our beef plants, I'm going to go to beef plants now,
17 are kind of working in a vacuum. If they don't know
18 the microbial loads coming in, how do they really
19 know what it is that their system is going to, those
20 multi-hurdles are going to be effective enough to
21 handle this. And maybe, Dr. Danielson, you can say
22 if it's even feasible as these prevalence rates go up

1 and down, how much time it takes for a plant to
2 adjust for such a, you know, change? So I think
3 though that just makes really good sense, and it was
4 just brought to my attention this morning, that there
5 are countries, other countries who actually -- cattle
6 that are being presented for harvest are actually
7 certified before they even come to the plant, that
8 there is a governmental regulatory role that does
9 these very things and so the plants are better
10 equipped to deal with whatever is being presented.
11 They know what they're being presented with.

12 Another thing that was just mentioned
13 during, Dr. Carr, you mentioned that interventions
14 targeted O157 are effective on non-O157 STECs as
15 well. And I guess I would just ask, and I'm not real
16 familiar with studies those have been.
17 Dr. Danielson, you mentioned -- you referred to a
18 study done by I think it was ARS, but I would like to
19 know what other maybe studies have been done by
20 industry and maybe some other academia as well.

21 And then I guess my question to both
22 Dr. Carr and Dr. -- and I don't mean to put you on

1 the spot, Dean, if you don't know this, is of your
2 research budgets, what percentage is going into pre-
3 harvest research and what is going into post?

4 DR. CARR: I'll start with that. From a
5 Beef Check Off side, in our research program, as I
6 presented, that has changed over time. Originally we
7 probably spent at least 75 to 80 percent of the
8 budget in the post-harvest area and then gradually
9 expanded that to include the pre-harvest arena, and
10 that has changed over time to where it is a pretty
11 even split on some years, and now even more research.
12 We're probably up at about 75 percent of the budget
13 being spent on pre-harvest with a continuation that
14 focuses on post-harvest as well.

15 MS. DONLEY: Thank you. Would you know,
16 Dean?

17 DR. DANIELSON: On a dollar standpoint,
18 that's very difficult because a lot of the work we do
19 on pre-harvest is collaborative with feed lots or,
20 you know, the drug makers, by providing facilities
21 and access and animals and sampling and laboratory
22 tests. So from an absolute dollar expense

1 standpoint, the pre-harvest, you just put it under
2 dollars of expense, probably pretty low but if you
3 look at the total resources committed, that we're
4 doing with resources, we spend a tremendous effort in
5 the last two years working with bacteria phage
6 companies with hide washes, working with cattle in
7 feedlots, running them through vaccination programs.
8 We've been -- beta sites for the feedlots on
9 vaccinations in our Canadian facilities and in some
10 of our facilities down here where those animals are
11 given access into our plants for the sampling of the
12 hides, and we do the sampling and we provide a lot of
13 laboratory support for those.

14 And those are even dollars that show up in
15 our budget, Nancy, but we have, you know, big
16 energies going at that, working with the feedlots and
17 working in our own stockyards in the areas where we
18 can do that. But it's very, very difficult to
19 measure, very difficult to measure these types of
20 things. That's one of the real frustrating things
21 about the whole deal.

22 MS. DONLEY: Okay. If I could just make

1 one last comment. Dr. Carr, it was very interesting
2 to hear that you're doing -- this is very interesting
3 to me personally, the pathogen ecology studies and
4 emerging pathogen studies. Are you looking at --
5 with emerging, are you looking at anything really in
6 particular or --

7 DR. CARR: Yes and no. We're looking not
8 only at the pathogens that have been seen in other
9 food, products not only in the United States but also
10 abroad. So that may be other strains of organisms
11 that we currently evaluate and other organisms such
12 as clostridium difficile, MRSA, Methicillin Resistant
13 Staph Aureus. So we're looking at other organisms
14 seen in other food products so that we can understand
15 our product better.

16 MS. DONLEY: Thank you very much.

17 DR. GOLDMAN: Okay. Let me check with our
18 operator once again and see if we have any questions
19 from our callers. Hello, Operator.

20 (No response.)

21 DR. GOLDMAN: Okay. We'll go back to the
22 room here. Ms. Buck.

1 MS. BUCK: Hello. My name is Pat Buck, and
2 I'm with the Center for Foodborne Illness, Research
3 and Prevention. And I have one question, and then I
4 also have another comment that I wish to make.

5 My first question is to Dr. Carr. You
6 talked about this study that you did that had the
7 10,000 plus samples, and out of that you found 15
8 that had non-O157, you know, *E. coli*, and of those 6
9 were at the virulent level to cause illness. Would
10 it be possible to share with us the testing
11 procedures or methodology you used in that study?

12 DR. CARR: Just a point of clarification on
13 that. First is the over 10,000 samples were
14 collected across multiple studies and the 15 that
15 were found were of that top 6 list --

16 MS. BUCK: Yes.

17 DR. CARR: -- that CDC produces --

18 MS. BUCK: Uh-huh.

19 DR. CARR: -- that are of interest. So I
20 don't have those methods right off the top of my head
21 but I'd be glad to --

22 MS. BUCK: Well, that's what I'm asking.

1 If you could share that because I mean I understand
2 that that's only a very small number of cases for the
3 amount of samples, but you have to look at how those
4 samples were collected. You have to look at other
5 criteria within the study, and I think Barbara
6 Kowalcyk would really like to review that.

7 All right. When you say only 6 have
8 virulent levels, Dr. Danielson referred to that
9 later, 6 out of 15, that's 1/3 and 1/3 of anything is
10 significantly important. So I think even though this
11 shows a very small amount, at this particular point
12 in time in this study, I think one of the things that
13 always I keep coming back to is that we have to
14 continue to test. You cannot test product safety. I
15 understand that. You cannot test enough to find all
16 the pathogens but by the same token, when you have
17 one-third of the ones that you found are positive,
18 that are really significantly possible to cause
19 disease, I think it's time to expand those testing
20 procedures.

21 And that brings me to my second comment.

22 DR. CARR: On that particular study, we had

1 15 of 10,000, that were -- those 15 met that list.

2 MS. BUCK: Yes, I understood.

3 DR. CARR: So it's not six that had the
4 characteristics. It's 15 out of 10,000, and that
5 list of 15 is strains that are on that list of --

6 DR. DANIELSON: So the one-third analogy
7 does not fit with what you have interpreted.

8 MS. BUCK: It's not one-third of the
9 samples. It's one-third -- you did say, I wrote it
10 down, maybe I misinterpreted.

11 DR. DANIELSON: Those 15 isolates belong
12 to --

13 MS. BUCK: And then six of those
14 isolates --

15 DR. DANIELSON: No, no, no.

16 DR. CARR: No.

17 DR. DANIELSON: No, no.

18 DR. LONERAGAN: The 15 isolates belonged to
19 6 serotypes. So --

20 MS. BUCK: Oh, I see. I didn't have a
21 second cup of coffee. I missed it.

22 DR. DANIELSON: It was probably my stumbled

1 words.

2 MS. BUCK: I'm sorry. I apologize. Okay.
3 As far as my comment, the one thing I just think, and
4 it goes back to the testing, I realize that we cannot
5 test 100 percent safety into a product. And right
6 now FSIS is coming to the beef industry and saying we
7 need to test what I call generically boxed beef
8 because these cuts could be used later on in ground
9 beef and once it's ground, there's a possibility for
10 future or more complications with, you know,
11 spreading disease throughout the consumer
12 environment.

13 I happen to agree with that. I think that
14 one of the things we have to do is we have to look at
15 this as a possibility. In 1996, STOP, Consumer
16 Federation of America, a lot of the people that work
17 on consumer safety here, were in this room trying to
18 put together the HACCP Program which was a huge, huge
19 step and you probably were involved in it. I wasn't.

20 I remember thinking at the time, because I
21 read about it in the Reader's Digest, wow, I'm really
22 glad that the meat is going to be safe now. And, of

1 course, I found out in 2001 that that really was not
2 what was in place.

3 As I started to look into food safety, one
4 of the things that just absolutely drove me crazy was
5 to find out that within six weeks of HACCP's
6 implementation into the large meat processing plants
7 or slaughterhouses, that they were given these
8 exemptions for the *E. coli* testing. And I just was
9 blown apart with that. Six weeks isn't enough time
10 to really find out if the system is going to work or
11 not. It was like the industry really didn't give it
12 a chance.

13 And this is one thing that I have brought
14 up. I grew up in rural America. I still live in
15 rural America, and there is a huge resistance out
16 there. When I asked yesterday what the barriers are,
17 one of the barriers is that we are resistant to look
18 at change, all of us are.

19 And I just feel that it is very, very
20 important that you say there's no technology to do
21 this type of testing. I think there is technology
22 out there. We just have to be willing to pursue it.

1 You say that there's no evidence, there's no evidence
2 that non-O157 is prevalent in this country. Europe
3 is telling us we need to start looking at this.
4 They're shocked that we're not looking at this. We
5 have got to start moving toward the future. The beef
6 industry as Nancy Donley pointed out, you go back far
7 enough, you're going to bump into an animal,
8 generally a cow, but it could be a pig, but you're
9 going to bump into an animal, and it's very important
10 for the industries that are the ones in charge of the
11 animal husbandry, the leadership there, to start
12 saying we need to start looking at that this is a
13 possibility that boxed beef could be contributing to
14 the continued rates and presence of *E. coli* O157:H7
15 in our food products.

16 DR. GOLDMAN: Thank you, Ms. Buck. Any
17 response there?

18 (No response.)

19 DR. GOLDMAN: Okay. We are into our break
20 time but we have a few more commenters or questioners
21 behind, so we'll try to get through these quickly and
22 still get a break.

1 MR. WOOD: I'm Richard Wood with FACT, and
2 I always know when a break time is coming I guess,
3 the story of my life, but I just have a comment and
4 then a question, or a question at least to hear some
5 reflection on.

6 Dr. Carr, I just want to observe -- well,
7 FACT hasn't really been in the room, and we're
8 certainly thankful for the other consumer groups that
9 have been here in the interim but since our focus has
10 been on pre-harvest and most of it has been on
11 processing and slaughterhouse practices, we have not
12 always been in the room.

13 But one time we were in the room, we were
14 in the room as HACCP was put together and also then
15 following that, when there was a discussion about
16 what research was going on. And, I recall sitting in
17 the room with players such as NCBA and asking, you
18 know, what research dollars were being spent in terms
19 of pre-harvest?

20 And then as you indicated, it was a
21 completely different answer, that most of the
22 research and most of the funding was focused on the

1 processing plant and, and it's heartening to hear
2 that there are funds now, a sizable amount of funds
3 being focused in that direction and the research has
4 been indicated in that regard.

5 I also appreciate your comment that there's
6 no magic bullet, and that there needs to be a multi-
7 hurdle approach and would be interested in later
8 discussions to learn how multiple interventions could
9 be put together and what kind of impact they might
10 have as the research right now is focusing on one
11 intervention in isolation of another. But we're
12 concerned that any intervention that has been found
13 to reduce pre-harvest O157 prevalence be carefully
14 reviewed to also understand what other human health
15 impacts that intervention might create.

16 And this goes to the magic bullet concern,
17 but it also goes to things like the use of Neomycin
18 which, of course, is already labeled, already
19 approved for cattle, has a quick withdrawal time, la
20 dee dah, but we also know what we're dealing with in
21 terms of antibiotic resistant bacteria and treating
22 human health diseases. And a couple of years ago

1 when we all came together to look at some early
2 interventions that were discussed at that time,
3 Neomycin was at the top of the pile. It doesn't
4 require a 12-year approval process. It could be a
5 magic bullet, and it could have detrimental effects.

6 And so I would hope that any intervention
7 is reviewed in those terms, that is so that we're not
8 causing other problems as we're seeking to address
9 this concern. I don't know if that deserves a
10 comment but you look like you want to speak,
11 Dr. Carr.

12 DR. CARR: I just want to address that and
13 then I would also ask that Dr. Loneragan as a
14 scientist speak to that, but as part of the approval
15 process in this research, we do look at those things
16 so that we make sure we're not causing any other
17 impact by addressing one.

18 And we do look at the development of
19 resistance and which items the organisms become
20 resistant to, and we do have data on that.

21 DR. GOLDMAN: Dr. Loneragan.

22 MR. WOOD: If that data is published, we

1 sure would love to have a look at that as well as you
2 go through the process.

3 DR. GOLDMAN: Okay. Thank you.

4 DR. LONERAGAN: Yes, I appreciate that
5 comment very much, and certainly when we're
6 evaluating some of these interventions, some of them
7 that are going to evaluation group at FDA, obviously
8 they have to show target animal safety, but they're
9 also going to have to show human animal safety. So
10 the evaluation process, while it's certainly far from
11 perfect, it does try to evaluate some of those
12 potential adverse effects.

13 When it comes to Neomycin, I think that's a
14 good example of discussion that we would have to have
15 if it ever got to using it, of what risks we were
16 willing to take to achieve what benefits, and that is
17 a discussion that needs to happen in time if that's
18 the case. But certainly I would argue as well as
19 that in those -- through the approval process,
20 they're not ignoring the human safety aspect and
21 having to show human safety.

22 DR. GOLDMAN: Thank you.

1 MR. WOOD: And related to that, also
2 another thing I just thought was with the distillers
3 grains and the use of that, there was concern, not
4 only about *E. coli* 0157 but also antibiotic use and
5 the presence there as well.

6 DR. GOLDMAN: Thank you.

7 MR. WOOD: A second very quick question is
8 Nancy mentioned this earlier about speaking about the
9 design sampling scheme which sounds from a lay
10 perspective, and that's who we are, in fact, we're
11 consumers although we do research and contracting
12 with other groups, a design sampling scheme or some
13 kind of systematic surveillance for 0157 prior to the
14 harvesting of those animals seems like a very logical
15 and important step and, Dr. Loneragan, you referred
16 to the need for that kind of surveillance.

17 How high a scheme do you see and in terms
18 of the barrier question, what barriers might there be
19 to put something in place that's sufficient to
20 measure the impact of any interventions?

21 DR. GOLDMAN: Thank you.

22 DR. LONERAGAN: What I proposed was an

1 opportunity for a macroscheme. It wouldn't
2 necessarily be a micro evaluation of pen to pen, lot
3 to lot, feedlot to feedlot. My suggestion was simply
4 a more purpose driven for a macroscheme to evaluate
5 are we seeing regional changes in prevalence that
6 warrant an intervention or aggressive approach.

7 Also if we had a purpose driven system, we
8 could evaluate changes in season over time. So if we
9 go to a situation where we have to say did something
10 happen in 200X, we could say, well, based on five
11 years it seems to be similar or dissimilar. That was
12 more the approach that I was taking.

13 MR. WOOD: Okay. Thank you very much.

14 DR. GOLDMAN: Thank you. Okay. We have
15 two more in the room. We have one on the phone. So
16 if we can have brief questions.

17 MR. MAIER: Wolf Maier -- I have a question
18 for -- would currently the basis allow FSIS to
19 prescribe that dirty cattle must not be permitted to
20 slaughter?

21 DR. GOLDMAN: I want to make sure I
22 understood your question. Do we have the authority?

1 MR. MAIER: Yeah, would -- allow you to
2 make such a requirement?

3 DR. GOLDMAN: I don't think we have the
4 authority to prohibit dirty cattle, is that what you
5 said, from coming into slaughter?

6 MR. MAIER: -- dirty animals must not be
7 slaughtered.

8 DR. GOLDMAN: I think what we've been
9 discussing here is that the issue that dirty cattle
10 may bring in terms of microbial loads into the
11 slaughter and processing plant, there are
12 interventions in place that are designed to address
13 that. I don't think at this point we have an
14 authority that we can exert that would establish a
15 criteria there. You know, I think it might be open
16 to discussion about where performance standards might
17 be appropriate throughout the process, and I'll leave
18 it at that.

19 DR. DANIELSON: David, could I just address
20 that real quick?

21 DR. GOLDMAN: Please.

22 DR. DANIELSON: You look at the seasonal

1 aspects of O157:H7, summertime, in our experience and
2 in our observations, O157:H7 is not a dirty cattle
3 phenomenon. It's dust. It's the grit and the gruff.
4 It's the hair. The high manure season, the
5 wintertime, it's not an O157:H7 issue. So the mud
6 scores and dirty cattle, it's other zero tolerance
7 related issues but it's not O157:H7 impacting.

8 MR. MAIER: Okay. Thank you.

9 DR. LONERAGAN: I would like to comment as
10 well on the issue of dirty cattle. Some countries
11 have gone, for example, Australia, at the --
12 Quarantine Inspection Service there, FSIS equivalent,
13 does prohibit the slaughtering of dirty cattle which
14 has turned into basically a disaster that has led to
15 feedlots trying to wash cattle. One feedlot that I
16 was recently at, they spend 10 hours a day to wash
17 400 cattle which has a lot of labor issues. They
18 can't keep anyone to wash them, but also if we look
19 at the data, the large packing plants here have found
20 that the most effective place to wash them is
21 actually within the plant, once the animals, the hide
22 on side of the plant. So I would reiterate what Dean

1 just said, that the manure time isn't the 0157 risk
2 period, but in that regard, if we want to clean those
3 cattle, the most effective place to do it is once
4 they're in the walls of the plant.

5 DR. GOLDMAN: Okay. Thank you. And we
6 have one call, a question from a caller on the phone.

7 OPERATOR: You have one call, Carol Tucker-
8 Foreman.

9 MS. TUCKER-FOREMAN: My question was
10 answered earlier. Thank you.

11 DR. GOLDMAN: Okay. Thank you. And we
12 have one remaining question in the room.

13 MR. NESMITH: David Nesmith, USDA, ARS from
14 College Station. I wanted to make a comment kind of
15 based on Mandy and Guy's data, on we are the pre-
16 harvest intervention strategy business in our
17 laboratory. For years, we didn't know what would be
18 an efficacious pre-harvest intervention strategy, and
19 we had no idea how many words of magnitude we would
20 have to lower the burden of 0157:H7 coming into a
21 plant.

22 Two years ago in Jacksonville, I think both

1 of you were at that meeting. The packers basically
2 said that they felt confident if we could lower
3 levels of O157:H7 between 10 to the 3, that their
4 post-harvest intervention strategies would be very,
5 very effective.

6 And if you take a look at the data that you
7 guys presented this morning, we're looking at 10 to
8 the 3, 10 to the 4 log drops, like with chlorate, and
9 recently Tom Besser's (ph.) laboratory published a
10 paper, basically in 2007. It said 96 percent of all
11 cattle with O157:H7 had a 10 to the 3 less, and then
12 the remaining 4 percent had up to 10 to the 6, with a
13 few, what we would refer to as super shedders.

14 So if you use that data when you're trying
15 to shoot for what is an effective intervention
16 strategy, that would suggest to me that any
17 intervention strategy that can drop O157:H7 levels by
18 3 orders of magnitude, would cover well over 99
19 percent of the cattle because we, you know, 1 percent
20 of them would may be 10 to the 6. We're down below
21 10 to the 3. That's how a post-harvest intervention
22 strategy should work.

1 Where that becomes important to me is how
2 regulatory authorities evaluate our efficacy data.
3 And so a nightmare for us is to have the Food and
4 Drug Administration be saying you need five orders of
5 magnitude reduction for a product to be efficacious
6 to be improved, when that would be way, way more than
7 what we need.

8 So we, I think, are starting to put
9 together a target for what an efficacious pre-harvest
10 intervention strategy is, and I think it's imperative
11 that the Food Safety and Inspection Service is a
12 regulatory agency with some pre-harvest authority,
13 have a conversation with the Food and Drug
14 Administration, to let them know what sort of target
15 we really need, what's important, in order to get
16 these products onto the market and speed up the
17 regulatory approval process. And that's one thing I
18 hope would come out of this meeting. Thank you.

19 DR. GOLDMAN: Okay. Thank you. Yes, go
20 ahead.

21 DR. LONERAGAN: I appreciate those last
22 comments and I'll make two very quick comments.

1 Firstly, when we look at the average shedding in
2 fecal samples across a variety of studies, they don't
3 usually shed on average three log. It's usually low,
4 three logs per gram. And so we have to be careful if
5 we set a target of three logs and they shed, we'll
6 never get anything that can meet that.

7 But setting standards is important and I
8 will say that NCBA, American Meat Institute, working
9 with FDA, USDA and the *E. coli* Coalition, to try and
10 work out what those standards should be and help at
11 least the regulatory agents work through that. So
12 that process is ongoing. Again, it's slow. It's
13 deliberated but sometimes frustrating but I think
14 progress is being made that it needs to be at such a
15 level that it warrants it, as well as we can get
16 those interventions approved. I appreciate the
17 comment.

18 DR. GOLDMAN: Thank you.

19 OPERATOR: Excuse me, sir.

20 DR. GOLDMAN: Yes.

21 OPERATOR: This is the operator. You have
22 one more questioning cue. Lisa Shine (ph.).

1 MS. SHINE: Hi, I'm Lisa Shine with the
2 University of Minnesota. I just want to ask a quick
3 little housekeeping thing. I didn't catch the
4 introductions and the agenda change this morning, and
5 I just wanted to find out Dean Danielson's
6 affiliation.

7 DR. GOLDMAN: He's the Vice President for
8 Food Safety and Quality at Tyson's Food.

9 MS. SHINE: Thank you so much.

10 MR. PAINTER: Stan Painter with the
11 National Joint Council. Sorry for getting up late.
12 I was afraid yesterday I stood in line so long that I
13 would be forklifted or drawn by my legs to the
14 microphone.

15 So anyway, nevertheless, some comments that
16 were made obviously that most of the contamination is
17 on the carcass. That's what Carr had said.
18 Obviously she's never been in a red meat plant where
19 you have high-speed evisceration equipment at 390 per
20 hour and you have fecal material being spread over
21 the carcass. And it was mentioned earlier that the
22 carcasses, the best place to wash them was inside the

1 plant. Obviously you've never been in a small red
2 meat operation. I have literally been in a red meat
3 operation that I could extend each arm and I could
4 have one arm touching the head and gut table and the
5 other arm with the carcasses coming in behind me.
6 There will be no room for those operations in these
7 small, small cattle and hog kills.

8 DR. GOLDMAN: Okay. Thank you for that
9 comment.

10 Okay. We haven't done too badly. We are
11 about 15 minutes behind, but everybody needs a break.
12 We'll take a 15-minute break and resume at a few
13 minutes past 11:00. Thank you.

14 (Off the record.)

15 (On the record.)

16 DR. GOLDMAN: Before we begin our last
17 panel, Dr. Carr has asked to respond to the last
18 comment that was made. So, Dr. Carr.

19 DR. CARR: Thank you. I just wanted to
20 take the opportunity so that -- right before we left
21 for break, we just ran out of time but to respond to
22 the last comment that was made about my experience.

1 One, first of all is I have been in large and small
2 plants for about 15 years. So I do have experience
3 in the operations there. I realize that they're both
4 very different and not only by their physical size
5 but what operations can be put in place.

6 The comment that was made towards the
7 washing of the animals and the hides was one as --
8 the other information was addressed as we know that
9 not all interventions are appropriate for every
10 plant. Many small plants have data that shows that
11 they do not need to employ that intervention step.
12 That's why we have those options.

13 What we do want to do is provide the
14 research data so that they can make that choice and
15 we can assist them in finding those options that are
16 effectively going to be able to move that through
17 science-based information. So thank you.

18 (Applause.)

19 DR. GOLDMAN: Thank you. All right. Thank
20 you for your attention. We're going to begin our
21 last panel. This will be a little bit different. So
22 let me tell you what we would like to do with this

1 panel. We have Dr. Engeljohn here. We have five
2 panelists truly from across the spectrum, not a
3 complete farm to table continuum, but we did hear a
4 little bit about pre-harvest and producers and
5 growers earlier, but certainly from production to
6 consumption and then once there is a failure in the
7 food safety system, even to the public health role in
8 finding cases and accurately counting the burden of
9 the illnesses that are caused by this particular
10 pathogen.

11 So what we've done is we've asked each of
12 our five panelists to provide us a relatively brief
13 presentation or opening statement and on the order of
14 a couple, two or three minutes.

15 And then each of you in your agenda should
16 have a list of questions that each of the panelists
17 will be asked to address as well as, of course,
18 anything that they may have heard during the course
19 of the meeting that they would like to address in
20 addition to the comments they'd like to make by way
21 of answering those questions.

22 What I want to do is we're going to have

1 the panelists just remain up here. I think everybody
2 can see them and hear them fine with the microphones
3 but I want to introduce all of them to begin with,
4 and then we'll just start in with the opening
5 statements.

6 So starting from close to me, Dr. Tim Jones
7 is an epidemiologist with the State Department of
8 Health in Tennessee and recently named the State
9 Epidemiologist there. He completed his medical
10 school training at the Stanford University and a
11 residency in family medicine at Brown University in
12 Rhode Island. He also did a fellowship in maternal
13 child health there. He practiced family medicine in
14 the underserved population in Utah before he joined
15 CDC's Epidemic Intelligence Service at which time he
16 was assigned to Tennessee, and has been there for
17 just over 10 years now.

18 He, in his responsibilities as State
19 Epidemiologist, oversees a broad range of programs,
20 not just, of course, foodborne and other communicable
21 diseases but immunizations, tuberculosis, emergency
22 preparedness, hospital infections and environmental

1 epidemiology. So we're very happy to have Dr. Jones,
2 who is also one of our close partners on FoodNet
3 projects.

4 Next to him is Mr. Hugh Tyler, who is here
5 representing a relatively small meat processor.
6 Mr. Tyler started in the meat business in 1964 and
7 started his own company in 1974, and he has been
8 under inspection both with the state and then more
9 recently at the federal level, since 1983.

10 And to his left is Dr. Randy Huffman who is
11 the Vice President of Scientific Affairs at the
12 American Meat Institute Foundation. He joined AMI in
13 January 2000 and manages their food safety research
14 agenda, assists the members of AMI in improving food
15 safety and quality and serves as the liaison between
16 AMI and other scientific organizations.

17 Prior to joining the AMI Foundation, he was
18 the Director of Technical Services for three years at
19 Koch Industries, K O C H, I should clarify, and
20 responsible for product development and food safety
21 with the Koch Beef Company. And prior to that was
22 Vice President of technical service at Fairbanks

1 Farms which is in New York State. He has a Bachelor
2 of Science in Animal Science from Auburn University
3 and both a Master's and Ph.D. in Meat Science from
4 the University of Florida.

5 And next to Randy is Donna Rosenbaum who is
6 Cofounder and Executive Director of Safe Tables Our
7 Priority, also known as STOP, which is the national
8 non-profit grassroots organization representing
9 consumers and victims of foodborne illness whose
10 mission is to reduce foodborne disease and deaths
11 from pathogens in the food supply through policy,
12 advocacy, building public awareness of foodborne risk
13 and providing victim assistance.

14 Donna has been actively involved in all of
15 these activities for nearly 15 years, and she has
16 personally worked with thousands of victims of
17 foodborne illness. And Donna has a degree in
18 neurobiology from Northwestern University near
19 Chicago.

20 And then the fifth panelist is
21 Dr. Engeljohn from our Office of Policy, our Deputy
22 Assistant Administrator whom you met yesterday.

1 And so again we're going to ask, just go
2 down the row here I think and ask each of the
3 panelists if they would like to comment generally
4 from their perspective on something they've heard
5 here or their perspective about what might be done to
6 improve the situation we had last year and to prevent
7 a recurrence.

8 So I'll start with Dr. Jones.

9 DR. JONES: Thank you very much for having
10 me. I think that I represent a very, very different
11 perspective than almost anybody who has spoken thus
12 far. I am at a State Health Department which is a
13 non-regulatory agency. I think here's probably a
14 good place to remind people that public health laws
15 are really all state laws. So what diseases are
16 reportable, how they're investigated, whether or not
17 we follow the FDA Food Code, all of those kind of
18 things are really at the state level rather than the
19 federal level which is really the level we've been
20 speaking at.

21 Many of you have also probably noticed that
22 almost virtually all of the talks that we've heard

1 thus far in terms of the farm to fork continuum has
2 really been at the farm level, pre-production,
3 production level with all of the arrows pointing
4 downstream.

5 And, I'm really representing much more the
6 fork level. We investigate human disease, and while
7 many of the agencies and organizations that are
8 speaking, all necessarily speak at the level of, you
9 know, percentages and sampling in large populations
10 of cattle, we deal at the human level where a unit of
11 one is too many, and our threshold for action is
12 basically zero.

13 All of the data that Dr. Tauxe and other
14 people have discussed in terms of human disease and
15 surveillance really is data from the local and state
16 level, where the diseases are reported. We're the
17 agencies in general that interview the patients, and
18 then report the data upstream where it reaches many
19 of the other agencies.

20 It also means that when trace backs or
21 recalls and things of that nature are instigated by
22 reports of human disease, much of our epidemiologic

1 data is what starts that trigger, and I'll also say
2 that because we're not a regulatory agency, we're not
3 a federal agency and therefore not bound by the legal
4 and political restrictions. We're a little bit freer
5 I guess to speak honestly, and can have a little bit
6 lower threshold in terms of the level of evidence
7 that in our mind, you know, are actionable and what
8 might drive a recall or trace back, and obviously
9 there always has to be a lot of negotiation back and
10 forth between the federal agencies that are then
11 using that data to do their much more in depth
12 investigations.

13 I think it's important to remember that,
14 you know, a lot of the data that you saw yesterday is
15 based on outbreaks, the way that many agencies sort
16 of count the burden of disease. They're the things
17 that get attention. It's very important to remember
18 that of all of the diseases, like *E. coli* 0157 get
19 reported to us, 3 percent are associated with
20 outbreaks, meaning that 97 percent, in the huge
21 burden of disease, are 1 or 2 what we call sporadic
22 cases which it's virtually impossible for us at the

1 epidemiologic level to identify for certain what
2 product those are associated with.

3 We face a lot of challenges. Yesterday
4 frozen products were mentioned, you know, if there
5 are products that are on the shelf for a long time,
6 why are they distributed, makes investigations very
7 difficult. I think the change in typical vehicles
8 from, you know, ground beef which has been our
9 assumption for many years now to products like leafy
10 greens and fruits and some of the other things that
11 were mentioned, make our investigations much more
12 challenging.

13 And finally I guess, in terms of being at
14 the fork end rather than the farm end of things, you
15 know, there's a lot of discussion about attribution
16 studies, and each agency sort of has a different
17 interest in terms of being able to attribute disease
18 to particular segments of industry, and when we see
19 disease, we're working the other way, upstream. So
20 we're often very interested in whether the disease
21 occurred because of an error or a malfunction in
22 terms of who cooked it, was it at a restaurant, was

1 it at home, where does the, you know, where should
2 more education be directed, and obviously we're at
3 the tail end of a very, very long chain of potential
4 interventions that allow the pathogen to be on the
5 fork. So I'll stop there.

6 DR. GOLDMAN: Thank you. Mr. Tyler.

7 MR. TYLER: Let me say it's a real
8 privilege to be here today and a real honor. I come
9 to you from the perspective of a very small meat
10 processor and I want to emphasize that very small. I
11 think the people who know me come to visit me at
12 home, they come to see my place, and they just, you
13 know, they can't believe it. They say, you know,
14 this is tiny but I've been in it a long time and I
15 want to bring the perspective today of what it feels
16 like to me as a very small processor and *E. coli* and
17 what we're facing today.

18 You know, as a very small processor, I am
19 really dependent on everybody above me, and that
20 includes the Agency and my suppliers, you know. The
21 suppliers is a battle when we want to buy the right
22 things from them, and most of the time your supplier,

1 when you're on my level, is not going to be the
2 packer. It's going to be a distributor. So when we
3 order and something comes in, we may get multiple
4 lots mixed in one and then we're trying to segregate,
5 we're trying to keep up, we're trying to track, and I
6 cannot control *E. coli* from coming in my plant.

7 What I can do is I can try to control and
8 process as though it is there, and I have to assume
9 it's there and control it as such. And so I've got
10 interventions, mainly temperature, we keep it cold
11 coming off the truck until it goes back on one of my
12 trucks and goes out and it's cold going into my
13 customer.

14 So we monitor and we record and we control
15 it that way. There's really nothing else available
16 to me, and so that's the discouraging part. Because
17 it's a huge problem, and this one pathogen is the
18 hardest for me to address, but having said that, and
19 you can understand the challenge that this is to me,
20 let me say it's a challenge. That's what it is but
21 it's not instrumental, and things like this meeting,
22 and meeting the people here in Washington, trade

1 associations, the other processors and the
2 universities and I go to a lot of the land grant
3 universities when I get a chance and try to learn
4 everything I can, all of that together gives a small
5 person like me a chance. Not only a chance to be
6 successful but a big chance is we don't make anyone
7 sick, and that's the goal.

8 So this meeting, to give my perspective on
9 the meeting yesterday and today, yesterday we heard
10 some things that sounded kind of gloom and doom, and
11 I'm thinking, well, you know, where's the hope, you
12 know, there were some negative things said.

13 And then this morning, with the panelists
14 that were up here, because my one belief has been
15 pre-harvest is where we need to be trying to address
16 *E. coli* and not necessarily test like -- I see
17 testing as a monitoring tool. I do not see testing
18 as a means to the end of what we're looking for. And
19 this morning, everybody that was talking, was talking
20 about the pre-harvest interventions that are being
21 worked on and in some instances are available now,
22 that seems to be the future.

1 And so I'll say what I've gotten out of
2 this meeting is I'm really encouraged, and I think
3 we've got this open dialogue is, is the kind of thing
4 we need. Dr. Raymond mentioned not to point fingers
5 yesterday morning. I agree with that, you know, we
6 point fingers at everybody and the small processor on
7 my level points fingers at the big packer and say,
8 hey, this is your problem. It's not their problem.
9 It's our fault. It's all of us, and we can work
10 together to find solutions and I'm encouraged that we
11 can do this.

12 I thought Nancy Donley made a good point
13 yesterday when she talked about working together and
14 supporting the efforts and supporting however we can,
15 whether it's through monetary, you know, with
16 vaccinations. They were talking about that there
17 would be a cost that would come along with that. I'm
18 perfectly willing to pay more money if I can get a
19 safe product. I think all of us are. And support
20 the Agency, but I'll stop with that.

21 But that's just giving you some heartfelt
22 views from a very small processor.

1 DR. GOLDMAN: Thank you, Mr. Tyler.

2 (Applause.)

3 DR. GOLDMAN: Dr. Huffman.

4 DR. HUFFMAN: Thank you, Dr. Goldman, and I
5 appreciate the opportunity to represent the American
6 Meat Institute on the panel today. I'm not sure I
7 can really adequately follow the comments of Tyler.
8 I concur on his statements at the end, that we're all
9 in this together and, you know, we need to work on it
10 collectively.

11 Going back to comments that Dr. Raymond
12 made at the opening yesterday, we concur that we need
13 stronger initiatives and they are needed. And we
14 agree that old responses aren't adequate anymore, you
15 know. We accept that and we concur.

16 I'll also point out that as Dr. Raymond
17 said, since this is a public meeting going on the
18 record, and I need to be precise in the comments that
19 I make here, rather than speaking from the cuff,
20 which I guess we'll do during the question and answer
21 session, I am going to make some specific statements
22 and read to you a few things that we believe are

1 important to put on the public record.

2 The American Meat Institute represents
3 about 650 members that process and produce meat
4 products and supply equipment and services to this
5 industry. And so, you know, we represent a broad
6 spectrum from both the large producers as well as
7 many small family owned companies.

8 So food safety is an extremely important
9 issue for us and, in fact, it's been our number one
10 priority for the last eight years since I've been at
11 the American Meat Institute. Food safety research
12 and education remains our top priority.

13 And we're committed to continuing our
14 cooperative work with each segment of the farm to
15 table continuum, and we're committed to applying all
16 the available best practices that we know work.
17 We're committed to complying with the existing FSIS
18 regulations. And implementing validated
19 interventions at appropriate points in the supply
20 chain and testing raw ground beef components for O157
21 have proven to be effective measures in the past for
22 controlling this hazard.

1 But we recognize that we need to redouble
2 our efforts and to identify why we've seen a leveling
3 in our improvement over the past several years and
4 the slight uptake of last year.

5 We recognize that that's an issue that
6 deserves our full attention and we'll continue to
7 focus on that.

8 I have two points that I really do want to
9 address. First of all, it's been suggested during
10 the program yesterday that the Agency's considering
11 the expansion of the adulteration policy to all
12 intact beef, and we've heard some discussion
13 regarding this. The American Meat Institute opposes
14 this expansion of the adulteration policy. We feel
15 that changes are not necessary, that they won't
16 address the problem and it's not necessary for us to
17 enhance safety. In fact, it could potentially be
18 counterproductive.

19 We feel that a properly designed and
20 executed HACCP plan addresses the risk of *E. coli*
21 O157 in raw ground beef and in non-intact beef
22 processing. Existing regulations and policies

1 regarding raw ground beef components address the
2 hazard that may exist for 0157 in ground beef and
3 non-intact products. HACCP plans in grinding
4 facilities should address issues presented by 0157
5 and as we heard from Dr. Engeljohn yesterday, these
6 steps should address the risk with the raw materials,
7 the product during processing at the facility and
8 also the intended use of the product.

9 These steps could include the
10 implementation of validated interventions on the
11 surface of the carcass, for antimicrobial treatments
12 on raw material is intended for raw ground
13 processing, either prior to the arrival at the
14 grinding establishment or at the grinding
15 establishment or both. Two, implementation of
16 validated interventions on ground beef product prior
17 to or after packaging, and there are some existing
18 interventions that could be use there.

19 Screening for 0157 on all raw material
20 components use in production of raw ground beef and
21 for treatment of bench trim. Just as any other raw
22 ground beef component, should be dealt with and

1 should be either designated for cooking only or
2 should be treated as any other raw ground beef
3 component.

4 To discuss the bench trim just a little
5 further, bench trim from primals, since primals are
6 essentially sterile and there's plenty of
7 documentation, that's really a surface contamination
8 issue that we're dealing with, and primals had never
9 been determined to present a risk from O157 prior to
10 this meeting. There are no documented cases of
11 intact steaks and roasts and frankly those products
12 will receive a full thermal lethality at their final
13 point of consumption.

14 So it's really an issue of the raw
15 materials that are derived that are used in ground
16 beef that is at issue here. And that the trim from
17 primals or the use of primals as direct components in
18 raw ground beef must be handled as any other raw
19 ground beef component. The industry agrees with FSIS
20 that establishments must take steps to minimize the
21 risk of O157 in all raw ground beef regardless of the
22 inputs that may be used to produce that produce.

1 Industry best practice recommends this.
2 BIFSCo best practices recommends this, and FSIS
3 policies already have an expectation that this should
4 occur.

5 As I said, there's been no documented cases
6 of O157 illness from intact primals that we are aware
7 of. We haven't heard any reported at this meeting.
8 The products in question that have been linked to a
9 small number of outbreaks have all been non-intact,
10 and declaring O157 as an adulterant of intact beef
11 would be counterproductive we believe and it would
12 divert valuable resources both at FSIS and at
13 industry away from targeting the highest risk
14 products which we believe would be ground beef and
15 other non-intact products.

16 And as stated during the first day of the
17 public meeting by FSIS staff, FSIS has collected no
18 significant data on the prevalence of O157 or other
19 pathogen on raw beef primals. There is some data
20 collection going on now but no data was presented at
21 this meeting.

22 There was also a statement yesterday that

1 there would be no formal risk assessment of this
2 issue of the risk presented by intact primals, and we
3 believe a regulatory decision of this magnitude
4 absolutely must include actual data that supports the
5 decision and a formal risk assessment that gets peer
6 reviewed that clearly outlines the relative risk
7 presented by these products.

8 My second point, and I'll be as quick as I
9 can, Dr. Goldman, we've also heard that the Agency's
10 considering expansion of the adulteration policy to
11 other non-O157 STECs, and I'll state for the record
12 that AMI opposes the consideration of expanding the
13 adulteration policy to include all non-O157 STECs on
14 beef, non-intact beef or intact. We don't believe
15 that it's necessary to enhance beef safety.

16 As was stated earlier on the program today,
17 the methods used to control O157, validated
18 interventions and best practices that are in place,
19 and the raw material screening, appropriately address
20 the risk of non-O157 STECs. The antimicrobial
21 treatments that are used are broad spectrum in
22 nature. Things, such as heat, we know based on the

1 published literature as well as practical knowledge,
2 microbiology, would be effective on other serotypes.

3 As described in the October '07 public
4 meeting that FSIS held, and again also at this
5 meeting, we've heard that there's currently no
6 standardized method in the FSIS laboratory or
7 available to industry for the routine detection of
8 pathogenic non-O157 STEC. Therefore, we don't
9 believe it's technologically feasible for FSIS to
10 implement such a policy at this time.

11 We've heard from both Dr. Tauxe at this
12 meeting and Dr. Hagen as well, also Dr. Griffin at
13 the October 2007 meeting, that there have been no
14 outbreaks in the U.S. for non-O157 STECs related to
15 beef, and this recognizes that non-O157 STECs have
16 been a reportable disease for several years in the
17 U.S.

18 We support the FSIS' approach to collect
19 further data on non-O157 STECs. We think that's an
20 appropriate approach, and we will work collectively
21 with the Agency to understand the risk that these
22 serotypes may present in our products. We have a

1 goal of achieving food safety and preventing
2 illnesses.

3 In summary, and I think you pretty much
4 heard my summary, so I'll defer my time, but I
5 appreciate the opportunity.

6 DR. GOLDMAN: Thank you, Dr. Huffman.

7 (Applause.)

8 DR. GOLDMAN: Ms. Rosenbaum.

9 MS. ROSENBAUM: Thank you. Good morning,
10 and I'd like to thank Dr. Raymond, Dr. Goldman and
11 USDA FSIS for the opportunity to be here on behalf of
12 STOP, on behalf of the consumer community.

13 I think most of the consumer comments at
14 this conference have been at the microphone. So I
15 welcome the opportunity to be up here and I know I
16 need to be brief. Most of my opinions and comments
17 will probably come out in the question section. So I
18 will be very brief in this introduction.

19 Our organization was born 15 years ago in
20 the aftermath of the watershed *E. coli*, Jack-in-the-
21 Box outbreak, and I need to add to my introduction
22 that my now college-age daughter's best friend was

1 the first child that died in that outbreak in San
2 Diego in 1992, and that's what brought me to this
3 issue in the first place. We have a very huge desire
4 to prevent this type of illness from exhibiting
5 itself in the human population.

6 We have over the years accumulated
7 thousands and thousands of case types and information
8 on *E. coli* disease as well as other foodborne
9 illnesses, and one of the things that we've been
10 advocating for the last 15 years, in which I do see a
11 huge movement in your having this conference here
12 today, and I commend Dr. Raymond for doing this, is
13 that we are very much prevention oriented and we have
14 always felt that Government and industry have been
15 somewhat reactive versus preventive in attacking the
16 pathogen load in the food supply. And I think that
17 at least in reference to this meeting, I see a little
18 bit of a culture change there, and I do see a
19 positive movement in terms of trying to get at
20 something before it really overtakes us. I see
21 movement in terms of trying to put ideas and theories
22 and material out in front of the whole constituent

1 basis to have an open dialogue so that we can move
2 towards prevention.

3 And when we're talking about *E. coli*
4 disease, or any of them, if we're talking about O157
5 or any of the other STEC diseases, these are nasty,
6 ugly pathogens. If you come face-to-face with this,
7 I encourage you to go onto our website and read the
8 stories of the people who have. These are awful,
9 awful, awful, awful disease processes and they really
10 need to be prevented wherever they can.

11 And in the last 15 years that our
12 organization has been working on this, there has been
13 a lot of progress in the public health side and in
14 laboratory techniques and detection. On the medical
15 side, in terms of treatment, there has been very,
16 very little progress. And right now at this point,
17 other than knowing that certain antibiotic treatments
18 will hasten the event possibly of further future
19 problems and the possibility of developing hemolytic
20 uremic syndrome. When we're talking about *E. coli*
21 disease, there really isn't a lot that the medical
22 community can do to treat these diseases differently

1 than they did 15 years ago.

2 So we're really depending upon you and the
3 Department of Agriculture and you in industry to
4 prevent this wherever you can. And as we just heard
5 recently, my co-panelist, one of the points I was
6 going to make also was that most of these diseases
7 present themselves, not in outbreaks, but in sporadic
8 cases of disease. I can't tell you the numbers and
9 numbers and thousands of people we have in our
10 database who had hemolytic uremic syndrome, have been
11 told they have, probably have *E. coli* disease they
12 had bloody diarrhea, but do not have something to
13 link that case to, and we're moving forward with a
14 lot of techniques to get at that in a better way, but
15 we're not there yet.

16 And so there's a lot of this disease out
17 there that we have to talk about in larger preventive
18 issues, and when you talk about prevention, I think
19 you can't pass the notion of cross-contamination.

20 Cross-contamination is a huge issue out
21 there. We feel that when pathogens -- origin are
22 evident in restaurants and/or consumer kitchens,

1 something has gone wrong, and that we shouldn't have
2 this burden to control as much as we do in those
3 environments. So it's up to everybody to prevent as
4 much as possible.

5 However, you know, the consumer community,
6 there's only so far the behavioral modification can
7 go, and we don't feel that that's going to get at
8 this issue at all. You have to get prevention at the
9 source. We really like the moving forward with pre-
10 harvest controls as much as possible.

11 But I want to take it even one step further
12 and encourage this Agency in its next moves, past
13 this meeting, to reach out to its other federal
14 partners and to take pre-harvest onto the farm with
15 them because we realize that there are a lot of
16 conflicting interest between the agencies and on farm
17 animal management that really need to be dealt with
18 if we're truly going to get to pre-harvest controls.

19 So this is a good step in the right
20 direction for this Agency with prevention, talking
21 with its constituency base, but I'd like to see all
22 of us come back and talk with a larger audience at

1 some point. Thank you.

2 DR. GOLDMAN: Thank you, Ms. Rosenbaum.

3 (Applause.)

4 DR. GOLDMAN: Dr. Engeljohn.

5 DR. ENGELJOHN: Mine will be brief. I've
6 had plenty of opportunity to identify from the
7 Agency's perspective the issues that we have but I do
8 want to just sort of tie some things together and
9 just have it for discussion this morning. And that
10 is, the Agency did want to have a prospective from
11 stakeholders on where we stand with regards to 0157
12 STECs and non-0157 STECs in terms of the products
13 that we regulate and then what we need to do about
14 that because we recognize that there are
15 vulnerabilities in this system, both within the FSIS
16 inspection system and the policies that we have, as
17 well as what we would consider to be the
18 vulnerabilities within the industry itself.

19 From that I would say that one thing
20 different today than in '99 or in prior meetings that
21 we had on 0157:H7, where we had large attendance for
22 public meetings, there was unanimity within the

1 industry itself I think at the time on how to move
2 forward and solutions, whereas I think we're at this
3 crossroads now where either through the experience of
4 implementing these programs over the last 10 to 12
5 years, there's more segregation within the industry
6 as to who can do what and who needs to be more
7 responsive. And I think from that perspective, it
8 identifies that we need new solutions.

9 So from the Agency's perspective, we're not
10 pleased with the fact that we met the healthy people
11 2010 goal in 2004 and have since not met it and what
12 we would see would be either the status quo or
13 perhaps some trending upwards as opposed to trending
14 downwards in human illness.

15 And we think it's now time to step in and
16 look at our strategies and see what we can do to
17 address this so that we can turn this trend around so
18 that we can get back to at least being preventative
19 for public health as opposed to just reacting to the
20 circumstances.

21 DR. GOLDMAN: Okay. Thank you. As I
22 mentioned, the questions that the panelists will

1 consider now are laid out for you, and I will point
2 out, too, there's not an opportunity for the audience
3 necessary to query this panel. We're hopeful that
4 all the questions that have been constructed for this
5 will bring out most of the issues, but there will be
6 public comment period for the entire meeting in just
7 a little bit.

8 I want to start with the first question to
9 just ask any of you, I mean we've heard you, some of
10 you echo comments from other panelists, but is there
11 anything you'd like to further agree or disagree with
12 that you've heard among your fellow panelists just
13 now?

14 DR. JONES: I'll make one comment. There
15 was a little bit of discussion about the amount of
16 disease that we see from non-0157 STECs and the
17 approach to that and, you know, the fact that there
18 hadn't been any recognized outbreaks in the U.S. I
19 hope that doesn't change, but one of the limitations
20 to that observation is that until recently, in the
21 human population, we've had no way to identify non-
22 0157 STEC or nothing really practical, very few labs

1 in the U.S. that had the ability to identify them.
2 And with the rapid increase in technology, now with
3 various rapid tests that can detect the toxin rather
4 than relying on culture, as a limited number of
5 states have gotten that technology, we're finding
6 that an increasing proportion of STECs are not O157
7 and in some states, the majority of STECs are non-
8 O157.

9 So I think as the detection of those
10 organisms increases, we may see a change in the
11 epidemiology of the disease.

12 DR. GOLDMAN: Thank you. Donna wants to
13 go.

14 MS. ROSENBAUM: I'd like to comment on that
15 as well, and my overarching comment is you can't find
16 what you're not looking for, and even though it's
17 been a reportable disease, again it has not been
18 looked for very carefully. The technology just
19 wasn't there.

20 And just as we saw with O157, being
21 declared an adulterant in 1994, that bold statement
22 led to a lot of technological advance. We feel very

1 strongly in the consumer community, it takes bold
2 action on the behalf of public health to drive the
3 technology, that you can't wait for the technology,
4 that the technology will come and you have to do
5 certain things with it. Thank you very much.

6 DR. GOLDMAN: Okay.

7 DR. HUFFMAN: I'd like to respond to
8 Dr. Jones' point also and certainly recognize that
9 detection methodologies are improving and recognize
10 that it's been a reportable disease for a relatively
11 short time. I don't remember when. Was it 2002 or
12 early 2000s. So I, you know, fully recognize that.

13 And, you know, if I had a crystal ball,
14 certainly I probably wouldn't bet against the fact
15 that we'll find certain non-O157 STECs associated
16 outbreaks in the future. And, in fact, I guess my
17 comment may be a question to Dr. Jones is that when
18 Dr. Griffin was here from CDC in October, at the
19 public meeting, she did show a slide with multiple
20 outbreaks identified with non-O157 STECs, multiple.
21 I can't remember the number but it was 20 or 30.

22 In every case I presume that the

1 attribution from that investigation was relatively
2 accurate, and in every case, it was some other source
3 and not beef. I would like a response to that.

4 DR. JONES: I agree and, you know, some
5 people in the audience may have better information on
6 that than I do. You know, I think that that sort of
7 open the door about understanding better what the
8 natural reservoirs are for the non-0157 STECs. It's
9 an important question.

10 MS. ROSENBAUM: Thank you. I'd like to
11 comment on that as well. From what I've read, and I
12 have done an extensive amount of reading on that,
13 non-0157, our organization has been following this
14 for at least the last 10 years, and we have quite a
15 few people within our organization who have suffered
16 from non-0157s, and I believe the literature in other
17 countries, the literature on imported beef coming
18 into this country, as well as looking at cattle
19 themselves, cattle carry this. They carry this by
20 itself. They carry it commensurate with 0157. And
21 some of those outbreaks by the way were from dairy
22 products and some of them were from leafy greens

1 again. They were contaminated potentially from
2 cattle manure. So I think to say that it's not a
3 cattle issue, that we wouldn't expect to find it in
4 beef I think is not being realistic.

5 DR. GOLDMAN: Dan, just reporting on the
6 fact that were presented at the meeting.

7 DR. ENGELJOHN: I'm not going to comment on
8 that particular issue but in terms of other things
9 that were said by the panelists, I do want to say
10 that I think it was important, the comments that
11 Randy made from the AMI perspective on recognizing
12 that the use of primal cuts for the intended use of
13 ground beef or for manufacturing trim, is something
14 that the policies do already address and that
15 industry themselves have recognized this as a thing
16 that must be dealt with, and I think a focus on that
17 in the short term, in fact, will be a very critical
18 issue to perhaps address what I would view as some of
19 the vulnerabilities that we have in the systems for
20 these overall approaches that we have in place. So I
21 think that would be very helpful.

22 DR. GOLDMAN: Thank you. We're going to

1 move to the other questions now, and the next two
2 questions actually are kind of paired together
3 because they're different. One is about your own
4 stakeholder group and the other is about what you
5 might recommend to other stakeholder groups, but this
6 is really the essence of what we want to get at in
7 this meeting. So if we don't even get past the next
8 two questions, I think this is very important.

9 So I'm going to ask each of you in turn
10 based on what you've heard, based on what you know,
11 what practical actions can your stakeholder group do
12 to contribute to decreasing foodborne illness related
13 to O157 over the near horizon because keeping in
14 mind, as we all know, we're entering this high
15 prevalent season in cow and probably in human illness
16 as well, and we really want to be able to attack
17 that. So go ahead.

18 DR. JONES: Yeah, I think there are a
19 number of things. I can only mention them briefly.

20 First, I think that standardized
21 investigation of outbreaks across the United States
22 and across states is critically important, and I

1 think it's no accident that you heard yesterday that
2 8 of 11 recent outbreaks were recognized and the
3 investigations led by FoodNet states which represent
4 only 15 percent of the U.S. population.

5 That's no accident. FoodNet states are
6 blessed with a lot more resources and capacity than
7 other states, but can do the math in your head to
8 figure out how many outbreaks that are occurring out
9 there in the other 85 percent of the population that
10 just aren't investigated or recognized.

11 I think that not surprising anybody,
12 maintaining an increase in that capacity depends on
13 funding, and the funding move for FoodNet states and
14 non-FoodNet states dedicated to outbreak recognition
15 and investigation has been going down, not up.

16 There are programs like PulseNet that are
17 threatened with market reductions and virtually all
18 of the multistate outbreaks which have recently been
19 recognized are dependent on detection through
20 PulseNet, DNA fingerprinting. If anything, we should
21 be adding the O157 STECs to it, not decreasing the
22 capacity in any way.

1 Lastly, I guess sharing data quickly
2 between our agencies, someone mentioned yesterday
3 that you all have lots and lots of databases but very
4 few of them talk to each other, and it's a shame that
5 there are data in regulatory and non-regulatory
6 agencies and in the industry that we can't all
7 benefit from.

8 DR. GOLDMAN: Okay. Thank you. Mr. Tyler.

9 MR. TYLER: Well, coming from a very small
10 processor's view point, I think the immediate thing
11 that I try to tell people when they call me, and I
12 would say this to anybody, you need to have a good
13 testing program, write it in your HACCP plan, believe
14 in it and do it even though I said before I don't
15 believe there's a means to the end, and I don't,
16 because it's a real needle in the haystack kind of
17 thing, but it's what we have to work with right now
18 and we need to utilize it as much as we can.

19 The major thing, test it, hold your
20 product. When you test, hold your product. If
21 Agency pulls a test, hold your product, and on both
22 of these questions, I'm giving the same answer.

1 Thank you.

2 DR. GOLDMAN: Thank you.

3 DR. HUFFMAN: I actually did my homework,
4 Dr. Goldman, so I had a response to the first
5 question as well. I'll do that real quick, and I
6 just wanted to say that I agree with Donna on a
7 couple of things.

8 First of all, the idea that we can modify
9 behavior of consumers and just tell them to cook
10 their ground beef to 160, I think Dr. Raymond is one
11 of those -- responses, that just doesn't work. We
12 need to continue education of consumers, but we
13 recognize that that is convincing every consumer to
14 use a digital thermometer when they cook ground beef,
15 is probably as difficult as trying to implement pre-
16 harvest intervention. So I agree with you there.

17 We have to recognize consumers use our
18 product in a certain way, and we need to develop
19 programs that address the risk related to that.

20 Secondly, I strongly support the comments
21 made by Donna and other consumer groups about
22 supporting pre-harvest intervention approvals at the

1 appropriate agencies.

2 To address this question, number 2, what
3 can we do, our segment, certainly there are multiple
4 things we can do and I haven't prioritized that list
5 necessarily with all of my various stakeholders but a
6 couple of things that float to the top and are things
7 that we have been talking through our BIFSCo
8 organization for the last year or more. And probably
9 the most important thing that we recognize that I
10 think Dr. Carr mentioned earlier is trying to get
11 what we believe to be best practices or good
12 manufacturing practices at the various steps in the
13 process, widely distributed, widely, you know,
14 increase awareness among all facilities and try to
15 provide training assistance to companies such as we
16 heard about yesterday from one of the small
17 manufacturers here.

18 As was mentioned earlier, there are experts
19 available on each of those best practices that can
20 answer questions. Trade associations are also a good
21 resource. So we are focused on trying to improve our
22 outreach.

1 And secondly, the other thing that floats
2 to the top based on what I heard at this meeting that
3 our segment needs to address, is what Dr. Petersen
4 presented yesterday with respect to the findings of
5 the FSAs. The common findings of those recent FSAs
6 are -- you know, our industry, we need to address
7 those things. We need to understand what we can do
8 better to comply with regulatory policies.

9 DR. GOLDMAN: Thank you. Donna.

10 MS. ROSENBAUM: Yes. Thank you. Speaking
11 more as a consumer advocate than as a representative
12 of consumers per se, as we just heard, consumers as a
13 group, there's not really much consumers can do at
14 the end of the food chain and attempts to do that
15 really have not been met with very much success.

16 So I'm going to speak from the viewpoint of
17 consumer advocate groups and say that we feel we've
18 had a larger and increasing voice and opportunity to
19 sit at the table and engage in discussions such as
20 this, and we truly appreciate that. We feel we do
21 have a lot to say.

22 Our organization, in particular, keeps a

1 pulse on what's happening out there since we are a
2 grassroots organization, and I would just make an
3 overarching comment just that the attitude in the
4 consumer community today is a little bit different
5 than it was 15 years ago, pre-Jack-in-the-Box, and
6 consumers respond to what's going on out there in a
7 much, much different way, and I think we're a lot
8 faster. I would just caution on everybody to be very
9 careful about consumer confidence and trust in your
10 products, and to not jump the gun and go out there
11 and battle against regulatory objectives that an
12 agency wants to do just because it's been the thing
13 to do in the past. Just be very careful on how you
14 handle that because consumer confidence in your
15 product and in your industry is very, very tenuous.

16 We hear it all the time on our help line.
17 Consumers call us all the time, why are they doing
18 this? Why are they doing that? We don't just hear
19 from victims. We hear from concerned consumers
20 nationwide, and there's a lot of topics that they get
21 very irritated about. So just a word of caution.
22 Thank you.

1 DR. ENGELJOHN: From the FSIS perspective,
2 being the stakeholder here, I know that there is
3 confusion on some of the policies we have with
4 regards to 0157 in particular, which components are
5 identified as primals that would be used for grinding
6 that should be included in a testing program that
7 likely are not being tested now. And I know we can
8 improve and enhance our policies to be more specific
9 and clear on that.

10 So I think that would be one thing that
11 would help, such as information to our field force
12 who we depend upon to collect samples for our
13 verification testing program.

14 And then the thing that I think, the short-
15 term, practical thing that others here at the table
16 are doing is -- it was mentioned earlier in the
17 morning panel that I know it's an industry led effort
18 and that is the CDs and guidance on N-60 testing, I
19 think would be extraordinarily helpful. Anytime that
20 there is a movement towards consistency and
21 uniformity within the industry as a whole, it helps
22 tremendously, and I think that that would be

1 something that would be very good. I'm anxious to
2 see it, to see what it does say, and then in talking
3 with Dr. Kelly earlier, if there's the opportunity
4 for the Agency through our efforts, our outreach
5 efforts in her program to distribute that, that would
6 be something that if we can sign onto that and do
7 that, we also think that that would be helpful in
8 that it's developed by industry, not necessarily by
9 FSIS, that's probably a helpful thing. And we'd like
10 to partner on that as well. We feel that's a very
11 positive step.

12 DR. GOLDMAN: Okay. Thank you. Why don't
13 we just continue down this way with Donna. We're now
14 on the third question. So this is your chance to
15 tell others here or even not represented on the
16 podium, a specific short-term action that you think
17 would be beneficial and why you think it would be
18 helpful and then maybe perhaps any barriers that you
19 might see from your perspective.

20 MS. ROSENBAUM: A short-term solution again
21 for consumers is difficult. I think we just need to
22 as a group continue our voice in advocating for

1 preventive measures. We need to make sure that all
2 stakeholders understand our position, and I think
3 something that has come out of this meeting is a
4 greater understanding of the necessity for getting
5 together and doing this more often, not just at these
6 meetings, but having open discourse as we are not
7 adversaries. We are in this altogether trying to
8 prevent this in the food supply. And I know on
9 behalf of myself, most of the consumer communities
10 will be very happy to explain our positions or
11 explain our opposition to certain things or
12 acceptance of certain things. If anybody in industry
13 would care to call us, we would be more than happy to
14 respond. And I think it's a shame that we only come
15 to these meetings have the short opportunities to
16 interchange.

17 So I welcome the opportunity and I think a
18 lot of the other consumers would as well.

19 DR. GOLDMAN: Okay. Thank you. Do you
20 have any other suggestions for any of the
21 stakeholders represented here for actions they might
22 take?

1 MS. ROSENBAUM: For actions they may take,
2 I would just suggest that they keep a very open mind.
3 We don't know everything. There's so much of this
4 that is out there that is not outbreaks. We're just
5 on the tip of the iceberg of understanding where this
6 is all coming from. So we need to keep a very open
7 mind.

8 DR. GOLDMAN: Okay. Thank you. Randy.

9 DR. HUFFMAN: A couple of things. This
10 one's for you, Dr. Goldman and Dr. Hagen, as well.
11 You mentioned the Agency in 2007, I guess the Applied
12 Epi Division investigated 37 potential illness
13 clusters associated with beef, 37 illness
14 investigations. We would be, I think our industry
15 would be aided if we understood the learnings from
16 those investigations at the appropriate time,
17 afterwards, in some summary form, so that we can
18 evaluate whether or not in those particular
19 situations where we know illnesses may have occurred,
20 were best practices followed.

21 First of all, did that implicated facility
22 comply with all the regulatory policies which are

1 required by law? That's question one. Secondly, did
2 they have an understanding of the industry best
3 practices under good manufacturing practices, and
4 were they implemented properly?

5 And those were the kinds of questions that
6 I think would be helpful as a retrospective look in
7 these investigations and certainly all 36 I guess
8 didn't result in recalls and maybe, you know, there's
9 a subset of this where there is useful information
10 that could be shared because right now there's not,
11 as far as we know, there's not a formal way for the
12 industry to learn about what's occurred. And to me,
13 that's probably where the most valuable data may
14 reside is when products actually may have been
15 associated with illness.

16 So that would be one suggestion.

17 DR. GOLDMAN: If I respond to that.

18 DR. HUFFMAN: Yeah, go ahead.

19 DR. GOLDMAN: I will tell you that your
20 point is very well taken and further will let you
21 know that the Agency is in kind of the final stages
22 of issuing a directive which, of course, is for our

1 own personnel but which will be widely read about how
2 we conduct investigations, a part of which will not
3 only be out thinking about how and when to take
4 actions, but also will cover issues like after action
5 reviews and final reports and the appropriate venues
6 for sharing that information.

7 So you can look forward to that, and it
8 might help with some of your concern.

9 DR. HUFFMAN: Great. The only other
10 comment I had was again reemphasizing the importance
11 of getting your sister regulatory agencies to have a
12 sense of urgency about addressing the need for pre-
13 harvest interventions. That would include both FDA
14 CDM and APHIS CBB. I don't think we have any of
15 those representatives at this meeting which I think
16 is unfortunate. If there is someone here, I
17 apologize but I haven't seen any.

18 DR. ENGELJOHN: This is Engeljohn. If I
19 could just add onto that, that I also think that's an
20 important thing that we can do. I mean that's part
21 of our responsibility, and the Federal Government is
22 to walk across our sister agencies lines and have

1 those communications. I would say sitting here, I
2 don't really know what are the issues, and so I think
3 a dialogue obviously would be helpful, but we
4 certainly are willing and able to step in because we
5 do, we, in particular, agree that any incremental
6 reduction in risk is worth the effort as opposed to
7 going for the full vein and get a maximum benefit.
8 Any reduction would be a positive thing to add onto
9 the tool chest of communications.

10 So if we can be better informed about what
11 you think the issues are, that too would be greatly
12 helpful.

13 DR. GOLDMAN: Okay. Go ahead.

14 MS. ROSENBAUM: Just a quick comment and a
15 quick request based upon that comment that
16 Dr. Engeljohn made. When you do reach out to the
17 sister agencies, it would be greatly appreciated if
18 you could make that as public a forum as possible and
19 not be done behind closed doors. Thank you.

20 DR. GOLDMAN: Thank you. Mr. Tyler, do you
21 have any suggestions for actions that others may
22 take?

1 MR. TYLER: Well, yeah, and I'm not sure
2 how it's going to be received. It may -- but in
3 talking about getting the sister agencies working
4 together, I totally agree with that. I think we're
5 going to hinder ourselves if we don't. You know, we
6 need to be talking all stakeholders and everybody.

7 And I think about down below me, in the
8 chain, we have the retail level and we have people
9 processing meat on the retail level that none of this
10 is available to, and so there's a sister agency
11 through FDA that they need to be part of this. And I
12 think that's an immediate need. Thank you.

13 DR. GOLDMAN: Thank you. Dr. Jones.

14 DR. JONES: I guess my primary suggestion
15 just has to do with encouraging rapid and thorough
16 and uniform investigations of disease and things that
17 sort of slip through the cracks. That's going to
18 require very rapid communication amongst sister
19 agencies. There are a lot of reasons for delays but
20 I think they can be relatively easily fixed, and it's
21 incredibly frustrating both for the victim, for us
22 and certainly for industry if we are trying to do an

1 investigation about something that has occurred a
2 month ago, and that's a frustratingly common
3 occurrence.

4 DR. GOLDMAN: All right. Thank you. Okay.
5 I'm just going to open this next question up to any
6 of you who might want to share any personal lessons
7 learned, successes or else recurrent barriers that
8 you want to share with the audience here that might
9 help us move forward. That's question number 4.
10 Anyone want to respond to that?

11 DR. ENGELJOHN: While they're thinking,
12 this is Engeljohn. I would say that a personal
13 experience here that has been insightful and one for
14 which we constantly are learning or at least I am, is
15 that in dealing with O157 as an adulterant, at a time
16 prior to the HACCP regulations issuing, it created
17 the necessity to look at what the HACCP process is
18 able to do or is expected to do and in particular
19 with raw products, where we have an adulterant which
20 is a unique situation.

21 And so I think from that from the
22 perspective of lessons learned and just issues over

1 time, it's taken a substantial amount of time for
2 everyone to understand how to implement HACCP in a
3 raw food system where it's much easier to do in
4 ready-to-eat operations, but that is required that
5 there be great understanding amongst all stakeholders
6 involved in terms of what is the minimum expectations
7 for either eliminating, preventing or reducing to an
8 acceptable level, and the Agency's defining that
9 acceptable level as being undetectable, and we have
10 since then established that the N-60 testing process
11 is one for which we can use as a standard to move
12 towards.

13 But in any case, just implementing a
14 nationwide regulatory system on raw products has been
15 quite enlightening and I think is something that we
16 always have to attend to as we think about going
17 forward and how we would address expanding the
18 policies.

19 DR. JONES: I hate to harp on the resource
20 issue, but I guess it's been very clear to me in the
21 last couple of days that the responsibilities that
22 USDA, also FDA and other federal and state agencies

1 are expected to do is just unbelievable and
2 unrealistic given the funding and the support that
3 they get, and as you all know, you know, federal
4 agencies here can't go out and lobby to get
5 themselves more resources very easily. So I think
6 one of the consumer groups stood up at the mic
7 yesterday and said, you know, what can we do? I know
8 that many of you do a lot of lobbying and contacting
9 influential people for increased financial support
10 for these agencies, and that's a critical function
11 that I would just encourage you to keep doing, and
12 it's not going to come from state legislatures. It's
13 going to have to be at the national level.

14 DR. GOLDMAN: Anyone else want to address
15 this question?

16 (No response.)

17 DR. GOLDMAN: Okay. Well, we'll move to
18 the next question, and we have addressed this
19 question in part through the course of the day and a
20 half, but are there any other gaps in our knowledge
21 for data that we could fill and especially practical
22 gaps that could be filled that might help us

1 ultimately reduce O157:H7, and if you can identify
2 what they are and how they might help, that is to
3 fill those gaps, let us know that, too. Anyone
4 have -- Randy.

5 DR. HUFFMAN: Well, just to reiterate the
6 question that I asked from the microphone yesterday,
7 with respect to the risk assessment that was
8 conducted early in this decade, it seems given the
9 significant amount of new data that we have, more
10 reliable data than what was used in that first risk
11 assessment, it seems that, you know, redoing that and
12 understanding the relative risk of various product
13 categories would be useful.

14 DR. GOLDMAN: Okay. Donna.

15 MS. ROSENBAUM: Yeah, I just wanted to
16 reiterate again the necessity for pre-harvest, but
17 pre-harvest not necessarily meaning just within the
18 scope of what this Agency and the beef industry can
19 do when cattle approach the slaughter facility, but
20 try to take it out of that box and just look at, like
21 Nancy said at the microphone, we deal with diseases
22 from cattle that come in water supplies, that

1 contaminate lettuce and crops, that get into
2 reservoirs that people swim in, that it affects the
3 human population in ways other than just beef.

4 And the reason I mention this to this group
5 is I know that's not necessarily directly under your
6 control. However, in addressing an approach to a
7 societal problem, I think we have to step out of the
8 box and for every incremental level include
9 production, when you take from the farm to the table,
10 I think as you go through that continuum, you lose
11 the ability of control at each level. You have a
12 much greater capacity to control it at an earlier
13 level than you do once it's going through that
14 system. So I would encourage again that
15 collaboration early on with sister agencies and other
16 organizations, it can get to on the farm practices
17 that would reduce the load coming in, in the first
18 place, and making those interventions much more
19 practical. Thank you.

20 DR. ENGELJOHN: This is Engeljohn, and from
21 my perspective, I don't disagree at all with what
22 Randy identified about the risk assessment, its

1 updating and using that to inform us where the
2 mitigation, in fact, would be perhaps most beneficial
3 and which products perhaps present that greatest
4 risk. So I think the Agency accepts that that's an
5 area where we need to focus in and move forward with,
6 but I would say that the one thing that we do
7 probably need now because of anticipation of where we
8 might end up in the future is that we really don't
9 have a good picture of the prevalence of O157 or non-
10 O157 or O157 STECs on cattle, coming to slaughter
11 before any interventions are applied or at least are
12 applied in a meaningful way, such that we can really
13 know what is there now and then once these pre-
14 harvest interventions become either more widely used
15 or available, that then we can really measure some
16 success that's occurring at that point.

17 And so because we don't have the
18 interventions from pre-harvest that are necessarily
19 effective or widely available, now would be the time
20 to at least initiate that kind of information either
21 through the industry, the Government or some joint
22 effort there so that we can really have a good

1 picture of what's coming to slaughter.

2 DR. JONES: I guess I would just follow up
3 on that to reiterate the point about encouraging
4 development of reliable and rapid diagnostic testing,
5 both on the industry side and the clinical side, that
6 waiting three days for a culture doesn't do anyone --
7 is very frustrating and the faster that you recognize
8 a problem, the more effective your mitigation can be.

9 DR. GOLDMAN: Mr. Tyler?

10 MR. TYLER: Well, listening to everybody
11 and what they've said, I agree with all of them. I
12 think it's a collaborative effort and like Donna said
13 and Randy said and Dr. Engeljohn and Dr. Jones, we
14 need to work together on this and the more data we
15 can get, the more we can advance and the better off
16 we're all going to be. It's a joint effort.

17 DR. GOLDMAN: Okay. Donna.

18 MS. ROSENBAUM: Another comment just in
19 summation, I'd like to add that our organization is
20 extremely concerned about the lack of data and
21 control we have. As Nancy mentioned at the
22 microphone yesterday, regarding imported products,

1 coming into the United States, with potentially other
2 pathogens that what we look for here, that are then
3 mingled and not visible to the American populace when
4 it reaches their table, that people don't know that
5 they're eating product from multiple countries when
6 they buy their products, and I believe that's a huge
7 gap. If we have 22 percent rate of imports into that
8 product category, I think we really need to look at
9 the pathogens of origin in those countries that are
10 providing that product, look very carefully at them
11 and make sure that we are screening for those.

12 DR. GOLDMAN: Thank you. Any last comments
13 on data or knowledge gaps?

14 (No response.)

15 DR. GOLDMAN: Okay. The last question for
16 the panelists to take up are whether you can identify
17 any additional ways that stakeholders can improve
18 their collaboration and communications. We certainly
19 have heard already a call for more meetings like
20 this, larger meetings. There are some perhaps
21 missing participants in this meeting. We've heard
22 that as well, but do you have specific suggestions on

1 next steps for our agency to perhaps host by way of
2 things that might improve communications and
3 collaborations in particular? Let's start with
4 Dr. Jones.

5 DR. JONES: Again, I come from a little bit
6 different perspective than others, but I think a lot
7 of the collaborations on the disease end have already
8 been initiated. We heard yesterday about
9 OutbreakNet, about CIFOR, Council to Improve
10 Foodborne Outbreak Response, and several others, all
11 of which are multiagency collaborations and it's
12 encouraging to me but there's still a long way to go
13 and particularly the involvement of industry and
14 consumer groups in those efforts is something that
15 could use a lot of improvement.

16 DR. GOLDMAN: Okay. Mr. Tyler.

17 MR. TYLER: I think communication is so
18 critical and the best way to reach the small and very
19 small meat processors, especially very small, is
20 going to be through state and national trade
21 associations. I can tell you now, they're going to
22 feel intimidated to come to somewhere like this and

1 they won't but they will come to a trade association
2 and they'll sit and they'll listen. And if the
3 different agencies would work with the trade
4 associations and come to them and the consumer
5 groups, too. I mean it would be good for consumer
6 groups to come to the meetings and have, you know,
7 and let some of the very small processors see that,
8 you know, we're all just people because right now I
9 can tell you they think this is boogie land up here.
10 (Laughter.) They're scared to come to this place.

11 DR. GOLDMAN: Thank you. Randy.

12 DR. HUFFMAN: I guess I would make one
13 suggestion that we all keep in mind as we continue to
14 communicate on this challenge that we all face, I
15 think, you know, to cover it briefly, as I've been in
16 boogie land here for the last eight years, in this
17 role, I've seen communications improve between
18 various stakeholders in my own experience. So I
19 think that's great.

20 But one thing I'd like to emphasize for all
21 of us to keep in mind, it takes off a comment that
22 Nancy Donley made yesterday with respect to

1 cost, and many of the things that we've talked about
2 here with respect to new Agency regulations or
3 policies, and reactions that the industry must take
4 to those policies, also with respect to any
5 additional interventions that might be put in plant,
6 and the interventions that have been put in plant in
7 the past, all have cost. Testing as we do it today
8 has an enormous cost. We estimate, and this is a
9 very, very rough guess, but -- well, let me just say
10 hundreds and hundreds of thousands of tests for 0157
11 are conducted every year. We've estimated it's
12 approaching a million samples a year by industry.
13 It's an enormous cost.

14 We talked about pre-harvest interventions
15 that are potentially effective, but they won't come
16 without a cost, and so I guess what I'm encouraging,
17 I'm not saying that that's the primary objective is
18 to only formulate our policies based on a low cost
19 objective, that's not what I'm saying. I'm just
20 saying that was communicate on how to solve this
21 problem, we need to keep in mind that each of these
22 actions do come with a cost, and I guess that is, you

1 know, part of the reason for the particular comments
2 I made earlier with respect to our objection to the
3 simple declaration of non-0157 as an adulterant, an
4 expansion of the policy on intact products.

5 We're not convinced on the data that we've
6 seen that those actions will have an effect on the
7 issue and we know, as business operators, that they
8 will come with very large costs. We don't know how
9 much but I think my point here is that as we have
10 communication about solutions, we need to keep in
11 mind that these solutions don't come free.

12 DR. GOLDMAN: Thank you. Ms. Rosenbaum.

13 MS. ROSENBAUM: I'm glad to see that there
14 was such broad participation in terms of attendance
15 in a meeting such as this. I'm a little disappointed
16 that we haven't had -- well, we've had a lot of
17 opportunity to open mics but we haven't had as maybe
18 open a discourse as we can with, you know, outside
19 ideas perhaps flowing as readily as they could have,
20 picking outside the box and so forth, and I think,
21 you know, consumer groups and consumer representation
22 in this room is maybe 10 percent of the total

1 population, and I think it's probably been about 90
2 percent of my time, other than the panels, and I
3 think that's a shame because I think we'd like to
4 hear from more of you around the room. That's one
5 comment.

6 The other comment is that in talking about
7 long-term solutions and collaborations, briefly
8 different panels brought up throughout the last
9 couple of days, there have been mention of, you know,
10 there's been mention of imported food safety in
11 different prevalence levels and different countries
12 of different Shiga toxin *E. colis* and different
13 attention to the adulteration issue in different
14 countries as well. So perhaps as we grapple this and
15 kind of move forward, we shouldn't be so insular to
16 just think that we need to solve this all on our own.
17 This is an increasingly global market that we're
18 living in, and perhaps we need to look at what some
19 other people are doing. So as we move forward with
20 future meetings, I think it would be encouraging to
21 see more international participation and input into
22 what we're doing and ideas coming from outside of

1 what we've thought of ourselves.

2 DR. GOLDMAN: Thank you. Dr. Engeljohn.

3 DR. ENGELJOHN: Well, the issue for me
4 really is opportunities just to have the dialogue and
5 if these large public meetings inhibit certain
6 sectors from participating, we do have to find ways
7 to get at that, and I know the Agency particularly is
8 focused on outreach to small industry to address
9 issues and if the issue is more technical meetings,
10 that do have representations from consumer groups,
11 industry and Government there, or whatever that mix
12 needs to be, as opposed to just being a technical
13 meeting or an interaction that's just with one
14 particular stakeholder, I think anytime we can find
15 ways to increase the stakeholder participation in any
16 meeting that we have, it's a good thing. So I think
17 we're always open to suggestions to how we can
18 improve that.

19 DR. GOLDMAN: Okay. Thank you. I'd like
20 to ask you to help me thank the panelists for their
21 thoughtful comments.

22 (Applause.)

1 DR. GOLDMAN: And they can be excused from
2 the podium if they'd like. We're now going to
3 transition to our public comment period. There were
4 sign up sheets. We only had one commenter sign up.
5 However, of course, this is the opportunity for any
6 of you here to make a statement for the record that,
7 of course, will be transcribed and will be part of
8 the Agency's considerations in addition to whatever
9 else has been presented at this meeting.

10 So we have Felicia Nestor who was the one
11 who signed up. So you can begin.

12 MS. NESTOR: Thank you. I actually didn't
13 even sign up. I asked them to sign me up. So it
14 looks like they did that.

15 Felicia Nestor, Food and Water Watch.
16 First, I didn't say before any of my other comments
17 because I was trying to rush, I really appreciate the
18 Agency putting on this meeting. I appreciate the
19 Agency bringing up this issue for public discussion,
20 and I also really appreciate all of the Agency people
21 that tried to help us get information prior to this
22 meeting.

1 Second issue, you know, Randy Huffman was
2 just at the end of his comments saying something
3 about, you know, we can't forget that there's a cost
4 to this and, you know, I'm more than agree with that.
5 I think we've got two problems here. We have the
6 problem of the pathogen, and we also have the problem
7 of the economics of dealing with the pathogen, and I
8 think more discussion on that, the better. I went to
9 the MMA conference and I heard a lot of the meat
10 processors talk about what they have to do to try to,
11 you know, promote food safety and, you know, my heart
12 really went out to them. It's difficult and from
13 what I'm hearing, and I don't know, I'm not an expert
14 on this at all yet, but from what I'm hearing, you
15 know, the beef industry is having a rough time right
16 now, and margins are shrinking and so perhaps some of
17 this problem is, you know, who's going to get caught
18 holding the hot potato. You know, is it going to be
19 the slaughter that has to apply the intervention to
20 the primal or are we going to hold the grinder
21 responsible for applying the intervention after it
22 gets into the grinding plant. I don't know if

1 there's a scientific reason for one or the other, but
2 my guess is that economics come into play pretty
3 significantly and if I were on one end or the other
4 of that, I would probably have a strong opinion.

5 You know, I appreciate the Agency taking
6 action in this, but to me it's a little bit arbitrary
7 that we're saying 2007 demonstrated that efforts were
8 ineffective, you know, because we had 29 positives,
9 but we could say that in 2006, with 20 positives, we
10 could just all relax because everything was
11 effective. I really hope the Agency, once we get
12 back down to 20 positives does not, you know, put
13 this on the back burner.

14 I thought the reason for this meeting was,
15 you know, what happened in 2007, can we put our heads
16 together? What the heck happened there? From what I
17 got from Dr., and I'm just going to mispronounce just
18 about everybody's name, Dr. Loneragan, there was no
19 evidence of significant increase in the cattle. So
20 we have to look at what's happening in the plants.
21 It looks like we may have had a previous inadequate
22 focus on bench trim. The question, were primals more

1 contaminated in 2007 because of the way things were
2 handled? Did something that there was a decreased
3 focus on slaughter and the dressing procedures, and
4 this is why I focused on the N-60 sampling.

5 The first thing, Dr. Samadpour said that,
6 you know, not all sampling is equal and FSIS
7 inspectors don't watch the plants do the sampling.
8 And what his data showed was that a plant can say,
9 yeah, this is what our evidence shows but if you
10 really do a thorough investigation of N-60, you know,
11 it's a much higher percentage that were contaminated.

12 As I understand the history, from 2003 to
13 2007, the large industry was testing about five
14 combos using N-60 and they were diverting the whole
15 five combos if that was positive. As I understand
16 it, in 2007, some have started testing one combo, and
17 if that is positive, they divert that.

18 Now that's, as I understand it, accepted
19 sampling and the danger that the Agency was saying,
20 that N-60 gives us a 95 percent positive rate of
21 finding the pathogen if there's 5 percent in the
22 combo. I never heard the Agency say there's 5

1 percent in the meat but, you know, from what I've
2 heard, they said .2 percent last year. Let's say 1
3 percent, the Agency just gave me the statistics this
4 morning. If there's 1 percent in a combo bin, there
5 is a 45 percent change of finding it if it's
6 positive. That means you are less likely to find
7 that it's positive if there's only 1 percent in the
8 combo. If we're talking .2 percent prevalence rate
9 which is what the Agency says, there is about a 90
10 percent chance that you will not find it in the combo
11 bin if it's there. So, you know, yesterday I was
12 asking, you know, why N-60, why N-60? And some of
13 the answers I got were, well, it's practical, you
14 know, it's the best the industry is doing at this
15 point, you know, but I think we need to understand it
16 may be practical, it may be the best, it may be the
17 only economically feasible thing we're doing right
18 now, but it's still a 90 percent chance you're not
19 going to find it if the combo is positive.

20 Dan told me today I am not understanding
21 the way the program works. I asked the Agency on
22 February 28th about this. I submitted questions.

1 I'm really trying to understand how this works, and
2 if it is not acceptance sampling. But what I got
3 back was, you know, you test the single combo. If
4 it's positive, it goes out to consumers. Dean
5 Danielson said 400 to 500 combos per day in a large
6 plant. Dr. Samadpour says up to -- let's say in a
7 bad time 20 percent of those could be positive. If
8 to whatever extent N-60 is being used as accepted
9 sampling, that is a heck of a lot of potentially
10 positive product going out to consumers. So that's
11 all I'll say on N-60, and I just have one other point
12 to make.

13 I noticed that the Agency stopped doing
14 *Salmonella* -- well, decreased *Salmonella* testing in
15 ground beef at least in the large slaughter plants in
16 2003. About two-thirds of the slaughter plants were
17 not tested for half or more of the full last four
18 years for ground beef. Some of them were tested for
19 steers, heifers, cows, bulls, but there was a radical
20 decrease in the *Salmonella* testing in ground beef.
21 The Agency seems to believe that *Salmonella* testing
22 is an effective way of boosting food safety practices

1 in broiler plants, and I think the Agency -- does the
2 Agency believe that the decrease in *Salmonella*
3 testing of ground beef could that have had an impact?
4 Thank you.

5 DR. GOLDMAN: Thank you for your comment.
6 Yes, sir.

7 MR. STEVENS: My name is Shawn Stevens, a
8 food safety attorney from Gass Weber Mullins in
9 Milwaukee. First of all, I want to thank everybody
10 for a fascinating discussion over the last two days,
11 and before we leave today, I think it's absolutely
12 imperative that we remind ourselves and we not let
13 ourselves forget, despite the issues that we're
14 grappling with, that we do have one of the safest
15 food supplies in the world, and that's in no small
16 part to the efforts of consumer advocacy groups, our
17 researchers, our FSIS inspectors, our regulators, and
18 most of importantly, industry itself.

19 And when we look at industry, we look at a
20 system, a food safety system of hardworking Americans
21 feeding Americans. And we've seen incredible success
22 over the last 10 years, despite the fact, as one

1 commenter put it yesterday, that sometimes industry
2 is being asked to do the impossible because of what
3 we know with respect to bacterial loads at the farm
4 level.

5 One of the reasons why we've seen success,
6 despite this, and I think it's very important to
7 remember is that industry, whether we're talking
8 about the larger packer or the small processor
9 represented by Mr. Tyler, is that industry, in
10 addition to feeding American consumers, is also
11 feeding themselves and their own families.

12 So as we move forward and we grapple with
13 these issues and we ask these questions, I think it's
14 very important that we keep in our minds, and we not
15 let ourselves forget and frankly I think we do need
16 to congratulate the industry for making our food
17 supply one of the most plentiful, one of the most
18 affordable and one of the safest this world has ever
19 known. Thank you.

20 DR. GOLDMAN: Thank you.

21 MR. LOVETRO: Dave Lovetro with Eka
22 Chemicals. Just a follow-up on a couple of comments

1 I heard from the last panel. Several of the
2 panelists mentioned the idea of perhaps an open form,
3 a transparent forum, where we could have all the
4 stakeholders, science, business and, of course,
5 regulatory who we think is perhaps underrepresented
6 today. I would certainly affirm that. I think that
7 the regulatory people need to hear the great
8 information that was presented at forums like this
9 and I would encourage USDA, FSIS, that that's the
10 appropriate vehicle to get something like that
11 rolling with the sister agencies. I think that's a
12 very important piece.

13 I can tell you that what you hear from
14 people like FDA and perhaps CDM, is that they
15 certainly are very well versed within the law and
16 with their guidance on how they deal with formal and
17 strict pharmaceuticals and drugs in feed additives
18 for example, which have actions on the feed.

19 This is a unique situation with many of the
20 pre-harvest interventions. You're talking about in
21 some cases dealing with an organism inside the animal
22 gut which we need to remember, even pathogens inside

1 the animal gut don't make the animal sick. It's not
2 an issue of structure function. So it's not the true
3 pharmaceutical drug claim that they're used to
4 handling.

5 They certainly need to hear a wide spectrum
6 of voices. They need to hear the voice of Government
7 who needs the toolbox to get the job done for food
8 safety. They need to hear the voice of industry who
9 will tell them what their needs are in terms of the
10 efficiency of how these products will work, and they
11 need to hear the voice of consumers so that they
12 realize the importance of the problem that we're
13 dealing with here.

14 The last point, just to follow up on Donna
15 Rosenbaum's comments, she would have liked to have
16 heard more in terms of new ideas and such. I think
17 the public forum is an important aspect of that as
18 well. The reason I say that is because I don't
19 believe that as a person who makes his living in the
20 world of business development which is trying to
21 develop products that I'm going to try to sell five
22 years from now, I don't believe that this problem

1 will be eliminated by science or technologists. I
2 think there's plenty of science and technology out
3 there but despite the fact of trying to move some of
4 the good interventions through the pipeline that we
5 heard this morning, you want to make sure that you
6 continue to draw people from industry and new
7 sponsors with the new products as well. But those
8 people will not necessarily come forward if they're
9 facing a regulatory environment which is going to
10 limit the probability of success of getting to the
11 end gate. So I ask everyone to keep that in mind as
12 well.

13 And again, I congratulate USDA and FSIS for
14 a really stimulated discussion.

15 DR. GOLDMAN: Thank you. Let me pause
16 herein the room for a second and see if we have any
17 public comments from phone participants?

18 OPERATOR: Once again, if you have any
19 questions or comments, please press star 1. One
20 moment please. If we have any questions or comments
21 from the phone line, please press star 1.

22 (No response.)

1 DR. GOLDMAN: Okay. Thank you.

2 OPERATOR: The first question comes from
3 Jeannie Meehl.

4 MS. MEEHL: Hi. Mine is in regard to the
5 information because -- through the phone, I really
6 appreciate you guys putting this on and letting us
7 call in and hear the thought, but because of the
8 background noise, I'm wondering is this going to be
9 posted on the web, in case I misheard something, I
10 can go back through and reread it?

11 DR. GOLDMAN: Yes. Thank you. The entire
12 transcript of this meeting will be available probably
13 in about two weeks and will be posted on our website.
14 Thank you.

15

16 DR. GOLDMAN: Any other public comment from
17 the phone participants?

18 (No response.)

19 DR. GOLDMAN: Okay. We'll go back to the
20 room then.

21 MR. CUSTER: Carl Custer, and I'm
22 unaffiliated, but I did retire from FSIS last year,

1 after over three decades of service.

2 I have a comment and a proposal. The
3 comment is in the case of Butts v. the American
4 Public Health Association, the Judge opined that the
5 American consumer is not stupid and they know to
6 thoroughly cook their meat products. Over three
7 decades of epidemiology have certainly poked a hole
8 in that Judge's opinion. And not only that, but they
9 did ignore cross-contamination in kitchens.

10 A proposal, premise number one. The
11 scientific literature has pointed out that there are
12 certain feedlots and dairy farms that are carriers of
13 O157:H7. Academics have also identified, and ARS,
14 have identified certain interventions that may work.

15 And then the next premise is that through
16 *Salmonella* performance standards, there are some
17 slaughter establishments that are optimal, do not
18 have a *Salmonella* performance standard failure, and
19 they have not had any O157:H7, but there are other
20 establishments that are sub-optimal. The proposal is
21 we could test animals anti-mortem and identify the
22 dairy farms and the feedlots coming into those

1 establishments that are carrying the O157:H7, either
2 testing fecal cavity, hides and fecal samples. And
3 then those animals in those establishments would be
4 passed for cooking, to be O157:H7 carrier animals, in
5 the same category as brucellosis, tuberculosis, that
6 secretaries have determined in the past that
7 consumers should not be exposed to. It would lower
8 the value of the animals from positive farms and
9 feedlots going to those establishments that are sub-
10 optimal. It would reward those slaughter
11 establishments that have been optimal because they
12 could take any animal and produce fresh beef from
13 those animals. It would be a cost and as Randy
14 Huffman said, you know, none of these actions go
15 without cost but inaction also has a great
16 epidemiological cost.

17 DR. GOLDMAN: Thank you.

18 MS. DONLEY: Nancy Donley from STOP, Safe
19 Tables Our Priority. I would just like to say I
20 think that the benchmark where we could really take a
21 look at, are we doing the job or are we just
22 maintaining or are we getting better, is in the

1 foodborne illness data.

2 We've been flat for the last couple of
3 years on the incidence of *E. coli* illness, and I
4 think that's a big black eye on the Government and
5 industry that we're maintaining the status quo and
6 not doing better. 2007 I think you each got dealt a
7 double black eye by just the enormous number of
8 recalls, foodborne illness outbreaks and I have to
9 applaud the Agency here, the USDA, for saying we're
10 not going to just stand here and take this black eye
11 and let this go on but by going forward and creating
12 initiatives being progressed, in their initiatives,
13 to say, this isn't good enough. We're not getting
14 the job done, and therefore looking to be proactive
15 in protecting public health and safety by moving
16 forward and declaring non-O157 STECs adulterant, by
17 moving forward in saying and looking at expanding the
18 definition of adulterated product to include intact
19 product, because frankly what's happening right now
20 just isn't having any impact on foodborne illness and
21 disease.

22 I have to say I'm really disheartened,

1 disappointed, by the extreme pushback I have been
2 hearing by industry on these new initiatives that the
3 Government is trying to put forward. I think that
4 there just deceiving themselves by thinking that they
5 can just continue along as usual and hold their
6 breath until we don't have another huge Jack-in-the-
7 Box in this 15th year anniversary, another huge Jack-
8 in-the-Box of a pathogen that is a non-0157 that we
9 know to be disease causing and death causing, until
10 they are willing to acknowledge that there is more
11 that needs to be done.

12 I applaud the Agency for being proactive.
13 I think industry here and trying to correct itself,
14 and frankly, trying to redeem itself in the public's
15 confidence by moving forward with these things, I
16 think industry has a lesson to learn here.

17 I want to thank you very, very much for a
18 very invigorating day and a half. I think that this
19 is a discussion that needs to keep going forward and
20 I hope that we can see some good news in the future
21 about trending down on these illnesses. Thank you.

22 DR. GOLDMAN: Thank you. Ms. Buck.

1 MS. BUCK: My name is Pat Buck, and I'm
2 with the Center for Foodborne Illness, Research and
3 Prevention and, Nancy, you did a great job, stole a
4 lot of the things I wanted to say but I will start
5 off by this.

6 Agriculture in this country for the past
7 decade has been over a trillion dollars each year in
8 revenues. That's big business. That's huge, and
9 when you look at the estimates, the cost of foodborne
10 illnesses and that type of thing, I know the USDA,
11 U.S. Branch put out a cost for foodborne illness back
12 in 2000, and said it was 6.9 billion. Well, you
13 know, that's a drop in the bucket when you're looking
14 at over a trillion.

15 However, the recent economic societal cost
16 on foodborne illnesses, have been based on
17 willingness to pay. How much is a consumer willing
18 to pay for food so that they don't get that tummy
19 ache or the three days or the more serious things.
20 And those estimates came out in 2007 saying that the
21 cost to society for foodborne illness is 1.4
22 trillion -- 1.4 trillion. That is huge, and I think

1 it's time that we all just start looking at this and
2 saying, people really don't want to get sick from the
3 food product and, yes, we do have one of the safer
4 food supplies in the world. We want to maintain
5 that. We certainly don't want to go backwards.

6 So everybody is going to have to start
7 looking to the indicators, those things that
8 Dr. Raymond asked us, you know, what are the
9 predicted indicators out there? This was at the
10 risk-based inspection meeting over a year ago now.
11 What are they? So we have to start looking to the
12 future to see what we can do to identify the areas
13 where it is likely that the enteric pathogens will
14 get mixed with the human intestinal tract and cause
15 tragedies or cause loss productivity just on a
16 regular basis.

17 I think the biggest thing I have gotten out
18 of this meeting is I feel encouraged, but like Nancy,
19 I feel discouraged. We need to have more access to
20 the type of dialogues where industry can interact
21 with consumer groups so that we know what's going on.
22 One of the gentlemen on the panel said, you know, why

1 don't you come to the trade shows. Well, it's
2 simple. Most of the consumer groups do not have the
3 money or the resources to go to the trade shows and
4 interact.

5 So I challenge industry, come and talk to
6 us, explain to us why you feel boxed beef is not a
7 problem. I look at it and it makes sense to me. Why
8 do you think that when Europe is reporting cases of
9 non-O157:H7 Shiga toxin-producing *E. coli* as their
10 major problem, and we don't really even consider it
11 here, why are we ignoring that?

12 Okay. So congratulations, FSIS, you did a
13 very good job in bringing together a lot of people.
14 I think the other thing that has to be mentioned is
15 that FDA is not here. FDA should be here. You need
16 to reach out and drag them over here because this is
17 where I speak to the people that I speak to, I say we
18 need to start bringing these agencies together,
19 talking more, so that we will have the basis for a
20 more collaborated approach to food safety systems.

21 The gentleman on the panel that talked
22 about the lack of public health resources, he is

1 absolutely right. Until we have more surveillance
2 opportunities on foodborne illness and until we have
3 more surveillance opportunities for food attribution
4 data, we're not going to get to the root of this
5 problem. I really believe that these public meetings
6 are important. I truly from the bottom of my heart
7 thank you. I think when the head of the FSIS Agency
8 says to everybody, it's time for us to look at boxed
9 beef, it's time for us to look at non-O157:H7, I
10 think that's a good indication that this public
11 health oriented leader is giving us some direction,
12 and I hope everybody pays attention to that. Thank
13 you.

14 DR. GOLDMAN: Thank you.

15 MR. PAINTER: Yes, Stan Painter with the
16 National Joint Council. To start with, I want to say
17 that I appreciate the opportunity to be here. I said
18 to Dr. Raymond yesterday that I don't think that my
19 organization has had access to the Under Secretary as
20 we have Dr. Raymond, and we certainly appreciate
21 that. And I'm sure that we come here and we say
22 things that probably Dr. Raymond don't agree with but

1 that's okay. When you get two people together,
2 you're not going to always agree.

3 I'd like to start out by saying we're all
4 consumers, and I don't care if you work with a
5 consumer group or for a consumer group or you work
6 for the Agency or your work for industry, we're all
7 consumers. It's not like just saying, you know,
8 there's a particular defective product, and I'm not
9 going to buy that product. We can't say that we're
10 just not going to eat. And I don't care if you're a
11 Ph.D. or you're just, you know, a regular person,
12 that's not highly educated, that, you know, fecal
13 material is not edible, and we all have to understand
14 that fecal material and the bacteria that comes with
15 it is not edible.

16 And, you know, I see people at these
17 meetings that they're with one organization and
18 they're preaching one sermon and then they go to
19 another organization and they're preaching another
20 sermon. We have a saying in the south, bless your
21 heart. (Laughter.) Then, you know, you need to take
22 a look at everyone being a consumer. Thank you.

1 DR. GOLDMAN: Thank you.

2 MR. WALDROP: Chris Waldrop, Consumer
3 Federation of America, and I wanted to address the
4 earlier comment about the contention that the U.S.
5 has the safest food supply in the world. And, as
6 we've heard over the last two days, there are people
7 in this room who have lost loved ones because of the
8 safest food supply in the world.

9 As Tim Jones said, one person who is sick
10 or ill from something they ate is one too many. I
11 think 5,000 every year is certainly way too many. So
12 I think that perspective is also important to keep in
13 mind as FSIS continues its look at this issue. And,
14 I commend the Agency for trying to take a more public
15 health-based approach to its activities than has been
16 done in the past, and for looking at these issues in
17 a broad way and trying to come up with preventive
18 strategies. So I think that's appropriate and I'm
19 glad the Agency is focused in that direction.
20 Thanks.

21 DR. GOLDMAN: Okay. Thank you. Let me
22 check with the phone one last time. Anyone on the

1 phone want to make a public comment?

2 OPERATOR: Anyone who would like to make
3 comments on the phone line, please press star 1. One
4 moment please.

5 (No response.)

6 OPERATOR: At this time, there are no
7 questions or comments.

8 DR. GOLDMAN: Okay. Thank you.

9 DR. HUFFMAN: Thank you, Dr. Goldman.
10 Randy Huffman, American Meat Institute. I would like
11 to make just one final brief comment on behalf of the
12 meat industry. I appreciate Chris' comments earlier,
13 that while we do believe we have the safest food
14 supply in the world, one of the safest, and by many
15 measures I think that we would all agree to that.

16 We also realize that we have progress yet
17 to make, and I think the participation of industry at
18 this meeting is indication of our commitment to do
19 everything that we can to control pathogens in our
20 product.

21 I'd like to, you know, make a couple of
22 comments in response to earlier statements that were

1 made. Industry is strongly committed to science and
2 research and solutions to solve this problem. We
3 have invested hundreds of millions of dollars. There
4 was a question asked to Dr. Danielson earlier, to try
5 to quantify that. It's very difficult to do but it's
6 hundreds of millions if not more than that, and we'll
7 continue to do that. As I mentioned earlier, it
8 remains, food safety research and education remains
9 our number one priority at the American Meat
10 Institute.

11 So with that, you know, I offer our olive
12 branch to work with the other groups represented here
13 in the room as well as FSIS to work on solutions.
14 And we encourage FSIS to consider some of our
15 comments that were made earlier with respect to
16 simply implementing a testing policy. We're not
17 convinced that that will make the product safer. So
18 let's look at the data and try and understand that
19 better.

20 What we know works and what we know will
21 work are interventions and solutions that are proven
22 and validated and the implementation of those, and

1 that's what we're committed to working on, to
2 continue to enhance the safety of our beef supply.
3 Thanks.

4 DR. GOLDMAN: Thank you very much. And
5 thanks all of you who have provided your comments
6 both now and earlier in this meeting.

7 One other just program note, some folks
8 have asked whether some of the presentations which
9 were especially delivered today would be available
10 and it is our intention to post all of the
11 presentations to our website, so you can have access
12 to the PowerPoint presentations at that time in the
13 very near future.

14 Sir, do you have one last comment?

15 DR. BAKER: Yes, thank you. I finally
16 decided that I should stand up and speak. First of
17 all, I wanted to introduce myself as Dr. Merv Baker.
18 I'm currently representing the Canadian Meat Council
19 but I'm also a former executive of the Canadian Food
20 Inspection Agency. So my background is quite
21 relevant to the matters at hand.

22 I wanted to thank FSIS for allowing

1 international participation. There was a comment
2 made earlier about approaching FSIS and others to
3 look beyond your borders. That's what we do. That's
4 what we're doing. When I was with CFIA, we always
5 tried to learn from other countries because the
6 problems that we face often appear in other countries
7 before we face them, and we were able to be prepared
8 to address issues because of that exposure. And I'd
9 encourage the U.S. to do the same thing.

10 I also wanted to say that, you know, we've
11 been trading for years. We're neighbors. We used to
12 talk about the longest -- border in the world pre-
13 2001, but we remain friends and very strong trading
14 partners. Massive amounts of product go back and
15 forth across the border.

16 And I just wanted to add that societally
17 we're not all that different either. We share the
18 same concerns that you have with food safety. We
19 also share similar challenges.

20 We have in Canada the same concern about
21 food safety. We are doing everything that we can,
22 that we feel we can, to enhance food safety. We

1 believe that as you do, Canada has one of the safest
2 food supplies in the world. But often I feel that
3 when you say that, and when I say that, it's a pretty
4 hollow remark. Yeah, it's safe, but it could be
5 safer.

6 I want to also reassure you that while we
7 have a concern about enhancing the safety of products
8 for Canadian consumers, our concern extends just as
9 much to foreign consumers of Canadian products, and
10 this is taken into account and covered by the
11 certification that CFIA does and the laws that Canada
12 has in place to insure the quality of products that
13 are being exported from the country.

14 The other comment I would offer from past
15 experience is that risk analysis is recognized around
16 the world as probably one of the most important tools
17 for dealing with issues like this. It's also
18 recognized as a critical tool by international
19 standard setting bodies and the World Trade
20 Organization. When you ignore risk analysis, you
21 often run the risk of doing the right thing -- not
22 doing what one should. Risk analysis comes in

1 different forms. Some take years. Others may take
2 minutes and I imagine Dr. Raymond has already done
3 his personal risk assessment and that's part of the
4 reason why he's advocating certain things but there
5 are intermediate positions as well. You can do risk
6 analyses in a relatively short period providing you
7 can generate the data that you need.

8 A critical part of risk analysis -- there
9 are three components of risk analysis. There is risk
10 assessment, risk management and risk communication.
11 At this meeting, there was a lot of discussion about
12 risk assessment and risk management, not very much
13 about risk communication, at least directly. And
14 that's something that I think we all perhaps need to
15 pay more attention to.

16 A component of that is to help consumers,
17 to help everyone understand and to help the regulator
18 understand the consumer point of view. One of the
19 things that you never -- with foodborne disease is
20 the importance of consumer education. It sounded to
21 me like you may have given up on that in the United
22 States, and I would recommend very strongly that you

1 consider that position. You won't change the world,
2 you won't change the whole country, but you will help
3 enhance the protection of many people. And I believe
4 there's sufficient evidence of that having been done
5 successfully in other countries and also in parts of
6 the United States.

7 So I share those comments with you.

8 DR. GOLDMAN: Thank you. Thank you very
9 much.

10 Okay. We are now at the end of our
11 meeting, and it's my pleasure to introduce our
12 closing speaker. Dr. Scott Hurd was fairly recently
13 named the Deputy Under Secretary for Food Safety. It
14 was February 12th to be exact, and Dr. Hurd most
15 recently was an Associate Professor at Iowa State
16 University's College of Veterinary Medicine and prior
17 to that, worked for about 15 years in USDA, both at
18 the Animal and Plant Health Inspection Service as
19 well as the Agricultural Research Service. So he has
20 quite a bit of experience in epidemiology and in
21 research as well.

22 Dr. Hurd received his Bachelor of Science

1 in Biology from Virginia Tech where he also happened
2 to play football during his time there. He also
3 received Doctorate of Veterinary Medicine from Iowa
4 State University and his Ph.D. in Epidemiology from
5 Michigan State University.

6 Please welcome to provide our closing,
7 Dr. Hurd.

8 (Applause.)

9 DR. HURD: Thank you, Dr. Goldman. I
10 suppose you folks are happy that he was introducing
11 the last speaker because I know everybody wants to
12 go. I see people looking at their watches. So I
13 don't really have a lot of significant or am not
14 going to take a lot of time.

15 This was certainly a dynamic, interesting
16 gathering for me, being my first public meeting as
17 Deputy Under Secretary, but it's not my first
18 experience with *E. coli*. Actually, before Jack-in-
19 the-Box, in APHIS, in the National Animal Health
20 Monitoring System, I encouraged us to test for the
21 prevalence of *E. coli* in dairy cattle. So we
22 published the first national prevalence estimate of

1 *E. coli* before Jack-in-the-Box. So I've been
2 watching this debate go on for many years, and I want
3 to reiterate what Dr. Raymond said, that this meeting
4 is just meant to open the dialogue and particularly
5 to work on what are the data? What are the science
6 that we need to respond to this issue?

7 Related to that, I can share with you today
8 that CDC just released their results for STEC, human
9 illness estimates for last year, 2007, and the
10 national prevalence estimate is 1.2 per 100,000. So
11 that's just a little bit down from the year before,
12 in '06, which was 1.3, '05 was 1.05.

13 So the good news is the rate of human
14 illness, even though we had recalls and issues like
15 that, the rate of human illness in the U.S. doesn't
16 seem to have increased.

17 The interesting thing to think about that
18 from a data standpoint is that if we say 1.0 per
19 100,000 times 300 million people, means about 3,000
20 cases of STEC O157 in the U.S. per year, and -- those
21 who die and each one of those is tragic and not
22 acceptable.

1 But then you take the other data that I
2 heard this last couple of days that says about 60
3 some percent of all those cases apparently, we think,
4 are due to meat and 44 percent of those are due to
5 beef, that works down to about 800 cases that we can
6 maybe do something about.

7 Now that's not to minimize the issue but
8 it's to bring out an important epidemiologic
9 principle. When you get to the bottom end of the
10 curve, for eradicating disease, it gets to be very
11 difficult.

12 Our sister agency, APHIS, has been trying
13 to eradicate tuberculosis for over 50 years, because
14 when you get to the bottom, it's very difficult.

15 On the good side, we think about there's
16 800 cases per year. We've got 100 million cattle, a
17 billion dollar -- in the meat industry. If everybody
18 just agrees to take one case off that list over the
19 course of a year, then it should be a relatively
20 small problem.

21 What we're struggling with is how to do
22 that? How do we take a big bite out of it or how do

1 we take another bite out of this issue?

2 I heard a few pieces of science mentioned
3 that are worth reiterating here. One is on the issue
4 of the non-0157s, the prevalence seems to be very
5 low, industry reports about 0.15 percent of their
6 samples, 10,000 samples, seem to be positive for
7 these. FSIS is going deeper into that question.
8 We're not actually expanding. If you remember what
9 was said, we're testing those samples we pull for
10 0157, will then be tested for the non-0157. Those
11 methodologies are actually still being developed and
12 you can recall Dr. Engeljohn's comments about
13 specific reactions to those. So we're just beginning
14 to understand what is the prevalence of that.

15 On the issue of pre-harvest, that's a
16 challenging one. Back when I was with APHIS in the
17 beginning, we launched into pre-harvest and started a
18 debate about whether APHIS should be in pre-harvest
19 or not, whether FSIS should be doing that, and what
20 we should be doing, and it's not an easily solved
21 issue.

22 As was explained to us today, the

1 prevalence is variable. Sometimes a pen, 5 percent
2 of the cows are positive and next month, same pen, 80
3 percent of them are positive. The challenge is,
4 recalling what Dr. Loneragan said, this is a
5 commensal organism, which means it's just passing
6 through the cow. It's just a passing participant
7 which makes it much more difficult to diagnose it in
8 the animal and to nail it down and do something about
9 it.

10 There's some good interventions that might
11 be able to help, particularly the one vaccine.
12 Yesterday the Deputy Under Secretary from Marketing
13 and Regulatory Services told the Secretary that the
14 train has left the station in the issue of
15 vaccination. So I think they've gotten their details
16 worked out and they will be able to approve
17 acceptable products for vaccination of *E. coli*.

18 Other additives like Neomycin, a very good
19 point raised there. When you start too mess with
20 this ecosystem, you add some antibiotics, you change
21 a lot of different things. So realizing that we're
22 involved in this dynamic ecosystem that involves

1 people, animals, bacteria, business, so sometimes you
2 push on one place and another area pops up.

3 Lastly, on the issue of plant processes,
4 what can be contributed, I take to heart the point
5 that AMI mentioned, the issues of investigations.
6 When we do an investigation, are there learnings from
7 those, and as Dr. Goldman mentioned, the Agency is
8 moving forward to getting more specific on those so
9 that when we do have an investigation, we find out
10 what the learnings are from that, and we try to feed
11 that back to people who can do something about it.

12 The other piece of data that I saw that was
13 most interesting was that only 15 percent of the
14 plants had a perfect score on those food safety
15 assessments that we came back and did, which means 85
16 percent of the plants can today improve in some way
17 on their existing processes.

18 So there's a lot of different ideas. Those
19 are just a few that I chose. I reiterate that the
20 store is open for public comments until May 7th. The
21 transcripts as noted will be available in the next
22 couple of weeks, as well as all the presentations.

1 We will take your input that we received and we will
2 act on it. I believe that major strides have been
3 made in this meeting, lots of good ideas, and I think
4 we're all moving forward to doing something about
5 this problem.

6 So with that, I'd like to thank Dr. Goldman
7 for moderating this, keeping us on time in an
8 excellent fashion, the other people who organized it
9 and hope you all have a safe trip home. Thanks.

10 (Applause.)

11 (Whereupon, at 1:00 p.m., the meeting was
12 concluded.)

C E R T I F I C A T E

This is to certify that the attached proceedings
in the matter of:

SHIGA TOXIN-PRODUCING *E. coli*

ADDRESSING THE CHALLENGES,

MOVING FORWARD WITH SOLUTIONS

Washington, D.C.

April 10, 2008

were held as herein appears, and that this is the
original transcription thereof for the files of the
United States Department of Agriculture, Food Safety
and Inspection Service.
