Dioxin FY 2013 Survey: Dioxins and Dioxin-Like Compounds in the U.S. Domestic Meat and Poultry Supply

INTRODUCTION TO THIS REPORT

In Fiscal Year (FY) 2013, the U.S. Department of Agriculture (USDA) Food Safety and Inspection Service (FSIS) conducted a survey to gather information on dioxins, furans, and dioxin-like polychlorinated biphenyls (PCBs) in U.S. meat and poultry products. This survey is part of the agency's effort to monitor dioxin in FSIS-regulated products as a prudent public health practice. This survey provides insight on changes in human exposure to dioxin-like compounds through dietary components. USDA conducted previous surveys in the mid-1990s with the assistance of the U.S. Environmental Protection Agency (EPA) and more recently in 2002–2003 and 2007–2008 with assistance from the USDA Agricultural Research Service (ARS). The information presented in this report uses the same format as the most recent survey report entitled "Dioxin and Dioxin-Like Compounds in the U.S. Domestic Meat and Poultry Supply" available on the FSIS website at http://www.fsis.usda.gov/wps/wcm/connect/ad01c1f4-878e-4a37-9103-de67eb7729d7/Dioxin_Report_1009.pdf?MOD=AJPERES.

In this report, dioxins, furans, and dioxin-like PCBs are referred to as dioxin-like compounds (DLCs).

DIOXIN

DLCs are ubiquitous and persistent environmental contaminants. The majority of DLCs in the environment are byproducts of combustion and manufacturing processes, such as paper manufacturing, and municipal and medical waste incineration. Dioxin-like compounds accumulate in the fatty tissues of humans and food animals consumed by humans. It is generally believed that the most significant exposure to DLCs by humans is from the dietary intake of animal and fish products. For further information on dioxins and food safety, see the document *Questions and Answers about Dioxins* posted on the Food and Drug Administration's (FDA's) website <http://www.fda.gov/Food/FoodborneIllnessContaminants/ChemicalContaminants/ucm077524.htm>

DLCs have different levels of toxicity. Toxic Equivalency Factors (TEFs) are toxicity potency factors established by the World Health Organization (WHO) to characterize the relative potency of each DLC. The individual DLCs are generally summed to yield a single Toxic Equivalent (TEQ) value. The TEQ is the summation of the products of individual DLC concentrations and their TEFs.

In 2005, WHO re-evaluated the TEFs after the 2002–2003 survey. In preparation for the Dioxin 08 survey, the TEQs of the raw data from previous USDA surveys in the mid-1990s and 2002–2003 were recalculated using the WHO 2005 TEFs (see Table 1). FSIS will compare the recalculated data directly to the data collected in the Dioxin 2008 and 2013 surveys. All TEQs presented in this report are based on the 2005 WHO TEFs.

Samples collected for analysis are adipose tissue (fat) samples from carcasses. The percentage of carcass fat actually varies by species, thus all findings are converted to a 100% fat level. These results are referred to as fat-based or lipid-based results.

PREVIOUS SURVEYS: (Mid-1990s), (2002–2003) and (2007–2008)

In the mid-1990s, USDA and EPA conducted surveys of DLCs in beef, pork, and poultry from slaughter facilities across the United States. The surveys found low levels of dioxin in samples from approximately 50 steers/heifers, 50 market hogs, 41 young chickens, 15 young turkeys, and a small number of samples from minor marketing classes. A survey of 510 beef, pork, and poultry samples

was conducted in 2002–2003 and 2007–2008, and the data from three surveys were analyzed and compared.

These surveys were conducted by different laboratories nearly 10 years apart, so a direct comparison of the data was not straightforward. To accommodate these differences, we took two approaches: (1) comparison with non-detects set to zero and (2) comparison with non-detects set to half the limit of detection. Specific information on these approaches can be found in the report entitled “Dioxin and Dioxin-Like Compounds in the U.S. Domestic Meat and Poultry Supply” available on the FSIS website (see section *Introduction to this Report*).

After comparing the data from the current and previous surveys, the dioxin levels appear to have declined in three of the four slaughter classes—young chickens, market hogs, and young turkeys declining 20–80%. Any declines in cattle dioxin levels, if real, are less than those observed in the other slaughter classes.

To clarify data on cattle, we examined cattle TEQ values. Both surveys have a similar percentage of steers and heifers with total TEQ levels greater than 2 ppt (nominally the 90th percentile of the mid-1990s surveys). The value from the 2002–2003 survey was 11% (15 of 139) compared to 16% (8 of 51) in the mid-1990s survey. This value decreased even more during the 2007–2008 survey, 6.5% of steers/heifers. None of the other slaughter classes exhibited such a high percentage of TEQ values at the high end of their distribution curves. A comparison of congener profiles from the mid-1990s surveys with the 2002–2003 survey indicated few major changes: 1,2,3,7,8-PeCDD, 2,3,4,7,8-PeCDF, and PCB- 126 were the dominant congeners in both sets of data, with 1,2,3,6,7,8-HxCDD another significant contributor in cattle (10% of TEQ in mid-1990s and 19% of TEQ in 2002–2003). Because the basic congener profiles for each slaughter class appeared to remain reasonably constant since the mid- 1990s, the general sources of dioxin exposures may be the same, although the overall levels of these substances in these sources may have decreased.

The comparison of the mid-1990s and 2002–2003 surveys shed light on the changes in environmental levels and human exposure to dioxin compounds through dietary components; however, further study is necessary to examine factors that might explain the differences in dioxin levels and distribution profiles in the four slaughter classes.

The comparison of the 2007–2008 data with the data from the two previous U.S. surveys show that the most prevalent PCDD/Fs in each survey and slaughter class were OCDD and 1,2,3,4,6,7,8-HpCDD followed, in most cases, by 1,2,3,6,7,8-HxCDD. Both OCDD and HpCDD are the most common congeners found in the U.S. environment. The increased prevalence of 1,2,3,6,7,8-HxCDD along with OCDD and 1,2,3,4,6,7,8-HpCDD may indicate a possible link to pentachlorophenol that has continued over the 10-year span.

DIOXIN 13 SURVEY

The Dioxin 13 survey was conducted using the same methodology and instrumentation as the 2002–2003 and 2007–2008 surveys. The sample strategy was designed to obtain 510 samples across product classes as follows: 136 market hogs, 139 steers and heifers, 151 young chickens, and 84 young turkeys over the course of one year. FSIS used a probability-proportional-to-size design to select establishments for the survey. Using this design, FSIS sample collection mirrored the percent of product slaughtered nationally.

Inspectors collected approximately 250 g of back fat from cattle, 250 g of belly fat from hogs, and 250 g of abdominal fat from young chickens and turkeys. The poultry samples were composites from three birds in the same flock. Individual samples were homogenized and a subsample (5 g) was analyzed for 17 polychlorinated dibenzo-*p*-dioxins and dibenzofurans (CDD/Fs) and three coplanar polychlorinated biphenyls (cp-PCBs) (#77, 126, and 169) by a method based on EPA Method 1613 (“Tetra- through octa-chlorinated dioxins and furans by isotope dilution HRGC/HRMS”) modified to include the three cp-PCBs. A method blank was analyzed with each set of nine survey samples and used for blank subtraction. A known spiked sample was analyzed at least twice each month. TEQ values were calculated using the 2005 WHO TEFs and reporting non-detects (nd) as zero (nd=0) or half Detection Limit (DL) (nd=DL/2). In most cases, mid- range data (nd=DL/2) will be used for discussion purposes in this report. All values are expressed in picograms/grams (pg/g) lipid (ppt lipid weight) after gravimetric determination of the lipid content.

DIOXIN 13 SURVEY RESULTS

The mean total pg TEQ/g lipid values across all dioxin surveys (mid 1990s–2013) can be found in Table 1.

The median total pg TEQ/g lipid values across all dioxin surveys (mid 1990s–2013) can be found in Table 2.

The D/F/PCB TEQ Trends-based on Median pg TEQ/g Lipid % Percent Change can be found in Table 3.

The Dioxin 13 survey was designed to monitor dioxins and dioxin-like compounds levels in domestic meat and poultry. The results of the survey showed mean total TEQ levels for beef, turkey, chicken, and pork were 0.66, 0.35, 0.13, and 0.13 ppt lipid weight, respectively. In order to compare previous surveys, TEQs from all datasets were calculated using the most recent 2005 TEFs, Table 4.

Table 1: Mean Total pg TEQ/g Lipid Values Across All Dioxin Surveys (Mid 1990s–2013)

Animal Class	Mid-1990s Survey	2002–2003 Survey	2007–2008 Survey	2012–2013 Survey
Market Hogs	1.42	0.22	0.16	0.13
Steers-Heifers	1.31	0.84	0.66	0.66
Young Chickens	2.23	0.29	0.17	0.13
Young Turkeys	1.43	0.57	0.61	0.35

The average congener concentrations for each slaughter class: market hogs, steers-heifers, young chickens, and young turkeys in the Dioxin 13 survey are presented in Table 5. The mean, median, and

range of the TEQs for each production classes are presented in Table 6.

Tables 7 through 10 list the pg TEQ/g lipid values for dioxin/furans, dioxin-like PCBs, and the combined DLCs using nd =0 and nd =DL/2 for all the individual 510 samples. Table 11 lists the detection limits for the twenty DLCs analyzed in the 2002–2003, 2007–2008, and Dioxin 13 surveys. The state where each animal was produced is also listed for each sample.

- Table 7: Market hogs samples
- Table 8: Steer/heifer samples
- Table 9: Young chicken samples
- Table 10: Young turkey samples

Additional data and information from the previous dioxin surveys are available by contacting the FSIS Congressional and Public Affairs office at (202) 720-9113.

COMPARING RESULTS FROM PREVIOUS SURVEYS

Overall TEQ median values for the slaughter classes have decreased in the last ten years (2002 to 2012) across all animal classes: Market hogs, Steer/heifer, Young Chickens, and Young Turkeys. See summary below:

Table 2: Median Total pg TEQ/g Lipid Values Across All Dioxin Surveys (Mid 1990s–2013)

Animal Class	Mid-1990s	2002–2003	2007–2008	2012–2013
Market Hogs	1.16	0.14	0.14	0.096
Steers-Heifers	1.01	0.49	0.42	0.38
Young Chickens	0.63	0.20	0.15	0.10
Young Turkeys	1.02	0.49	0.46	0.30
Sample Size N:	163	510	510	515

A statistical comparison of the 2002–2003, 2007–2008, and 2012–2013 survey data were possible, because the methodology and detection limits of the surveys were similar and had lower LODs (see Table 8). **Note:** Higher detection limits in the survey conducted in the mid-1990s make it difficult to compare directly these data with the later surveys. See summary below

Table 3: D/F/PCB TEQ Trends-based on Median pg TEQ/g Lipid % Percent Change

Animal Class	2002–2003 vs. 2007–2008 Surveys	2007–2008 vs. 2012–2013 Surveys
Market Hogs	0 %	- 31 %
Steers-Heifers	- 14 %	- 9.5 %
Young Chickens	- 25 %	- 33 %
Young Turkeys	- 6 %	- 35 %

Data from 2002 to 2008 shows that the median TEQs had declined by 14% for beef and 25% for chicken with nearly equal declines in both PCDD/F and PCB TEQs. The median TEQs for young turkey were relatively constant for the two surveys time periods (6% decreases in total TEQ). The TEQ data similarity between 2002–2003 and 2007–2008 for market hogs depended on the approach used for treating non-detects. Using nd=DL/2 for the hog TEQ data leads to the conclusion of median TEQs showing no change.

Data from 2008 to 2013 shows that the median TEQs had decreased by about 9.5% for beef, 31% for pork, 33% for chickens, and 35% for turkeys respectively. TEQ values for the slaughter classes appear to have decreased in the last five years. In general, turkeys and beef continued to have the highest median TEQ levels.

Both turkey and beef had a wide range of TEQs with one sample in each class exceeding 4.0 pg TEQ/g lipids in the 2007–2008 survey; however, only one beef exceeded 4.0 pg TEQ/g lipids in the 2013 survey. If outlier TEQ values from turkey samples, from an identified localized contamination, are excluded, steers and heifers generally had the widest range of pg TEQ/g lipid values. This is expected given that cattle in the U.S. graze on a wide variety of pastureland across the country, whereas poultry and pork production is typically confined and integrated with large feed suppliers.

In spite of the difficulties of comparing data from different laboratories and periods, data from three USDA surveys conducted in the same laboratory show a decreasing trend in pg TEQ/g lipid values over the past decade for domestic meat and poultry. The congener patterns remain relatively constant between 2002 and 2013 indicating similar animal exposures to dioxins and dioxin-like compounds during these periods.

Table 4. Mean and median pg TEQ/g lipid values for Dioxins/Furans and Dioxin-like PCBs in Previous USDA Dioxin Surveys

		Mid-1990s Survey			2002–2003 Survey			2007–2008 Survey		
		Number of Samples	Median TEQ	Mean TEQ	Number of Samples	Median TEQ	Mean TEQ	Number of Samples	Median TEQ	Mean TEQ
Steers/ Heifers	Dioxins/ Furans	51	0.73 (0.02)	0.94 (0.32)	139	0.36 (0.31)	0.71 (0.67)	139	0.31 (0.27)	0.55 (0.51)
	Dioxin-like PCBs		0.27 (0.27)	0.37 (0.37)		0.11 (0.11)	0.13 (0.13)		0.09 (0.09)	0.11 (0.11)
Market Hogs	Dioxins/ Furans	56	1.11 (0.03)	1.38 (0.39)	136	0.12 (0.03)	0.19 (0.11)	136	0.12 (0.02)	0.14 (0.04)
	Dioxin-like PCBs		0.02 (0.00)	0.04 (0.03)		0.02 (0.02)	0.03 (0.03)		0.01 (0.00)	0.02 (0.01)
Young Chickens	Dioxins/ Furans	41	0.45 (0.14)	2.04 (1.79)	151	0.13 (0.06)	0.21 (0.14)	151	0.11 (0.02)	0.12 (0.04)
	Dioxin-like PCBs		0.11 (0.11)\	0.19 (0.19)		0.05 (0.05)	0.08 (0.08)		0.03 (0.03)	0.05 (0.05)
Young Turkeys	Dioxins/ Furans	15	0.56 (0.39)	0.97 (0.78)	84	0.29 (0.25)	0.38 (0.34)	84	0.31 (0.28)	0.36 (0.34)
	Dioxin-like PCBs		0.40 (0.40)	0.46 (0.46)		0.15 (0.15)	0.19 (0.19)		0.14 (0.14)	0.25 (0.25)

Note: Results are expressed in pg TEQ/g lipid. Data are blank subtracted. All results reported on a lipid basis with Non-Detects =Detection Limit /2 and Non-Detects = 0 in parentheses. Mean and median TEQs were calculated using 2005 WHO TEF values.

Note: Results are expressed in pg TEQ/g lipid. Data are blank subtracted. All results reported on a lipid basis. The mean TEQ for all 20 DLCs may not equal the sum of the mean TEQs for dioxins/furans and PCBs due to rounding.

Table 8. TEQ Values for Steers/Heifers Samples (n=139) in the Dioxin 13 Survey

Note: Results are expressed in pg TEQ/g lipid. Data are blank subtracted. All results reported on a lipid basis. The mean TEQ for all 20 DLCs may not equal the sum of the mean TEQs for dioxins/furans and PCBs due to rounding.
